Answer: C

Explanation:

Points to remember:

- * XML must have a root element.
- * XML only allows one root element
- * To avoid multiple root issues, you must create a root element for the XML output, whenever we transform output

* When mapping array elements (JSON or JAVA) to XML, wrap the mapoperations in {(..)}

- { } are defining the object

() are transforming each element in the array as a key/value pair

* The transformation to XML would fail if the above mentioned considerations were not taken into account.

* Thus the transformation script declares a root element as trains and wraps the data in "{()}".

Whenever you see such type of question, always look out for root element followed by {()} wrapping map.

I call this a "Wrap The Map" scenario. Hope it would help you remember !
