| トピック 1 | <ul style="list-style-type: none"> <li>• SAP Business Data Cloud: This section of the exam measures the skills of Data Analysts and covers core concepts of the SAP Business Data Cloud. Candidates are expected to understand its key components, integration mechanisms, and how it functions as a foundation for unified data management across SAP and non-SAP environments. The focus is on enabling data connectivity and providing governed access to data across the enterprise.</li> </ul>  |
| トピック 2 | <ul style="list-style-type: none"> <li>• SAP Analytics Cloud: This section of the exam measures the skills of Data Analysts and covers the use of SAP Analytics Cloud in data visualization, story building, and dashboard creation. Candidates should be familiar with its planning and predictive capabilities, along with how to utilize data insights to drive business decision-making. It also includes managing user access and collaborating through shared analytics assets.</li> </ul>     |
| トピック 3 | <ul style="list-style-type: none"> <li>• SAP Datasphere: This section of the exam measures the skills of Solution Consultants and covers a comprehensive understanding of SAP Datasphere. Candidates should demonstrate knowledge of data modeling, transformation, and harmonization using SAP Datasphere tools. It evaluates how well they can work with data layer structuring, semantic modeling, and integration to support real-time data access for various business applications.</li> </ul> |

## SAP Certified Associate - SAP Business Data Cloud 認定 C-BCBDC-2505 試験問題 (Q14-Q19):

### 質問 # 14

What are the primary purposes of SAP Business Data Cloud?

There are 2 correct answers to this question.

Response:

- A. To provide foundational services for data and analytics scenarios.
- B. To provide a homogeneous system landscape for data, functions, and use cases.
- C. To act solely as a data storage solution without analytics capabilities.
- D. To provide mainly manual data integration scenarios.

正解: A、B

### 質問 # 15

How does SAP Business Data Cloud support self-service analytics enablement?

Please choose the correct answer.

Response:

- A. By using SAP NetWeaver Gateway integration
- B. By offering static reports through scheduled email
- C. By exposing business-friendly models to SAP Analytics Cloud
- D. By embedding dashboards into Microsoft Excel

正解: C

### 質問 # 16

Which of the following can you do with an SAP Datasphere Data Flow? Note: There are 3 correct answers to this question.

- A. Delete records from a target table.
- B. Integrate data from different sources into one table.
- C. Fill different target tables in parallel.
- D. Write data to a table in a different SAP Datasphere tenant.
- E. Use a Python script for data transformation.

正解: B、C、E

解説:

An SAP Datasphere Data Flow is a highly versatile and powerful tool for data integration, transformation, and loading. With a Data Flow, you can effectively integrate data from different sources into one table (B). This is a fundamental capability, allowing you to combine data from various tables, views, or even external connections, apply transformations, and consolidate it into a single target table. Another advanced capability is to fill different target tables in parallel (D). Data Flows are designed to handle complex scenarios efficiently, and this parallelism optimizes performance when you need to populate multiple destination tables simultaneously from a single flow. Furthermore, Data Flows support extensibility, allowing you to use a Python script for data transformation (E). This enables advanced, custom data manipulation logic that might not be available through standard graphical operations, providing immense flexibility for complex business rules. Writing data to a different Datasphere tenant (A) is not a direct capability of a Data Flow, and deleting records from a target table (C) is typically handled via specific operations within the target table's management or through SQL scripts rather than a standard data flow write operation.

#### 質問 # 17

Why would you choose the "Validate Remote Tables" feature in the SAP Datasphere repository explorer?

- A. To detect if remote tables are defined that are not used in Views
- **B. To identify structure updates of the remote sources**
- C. To test if data has been replicated completely
- D. To preview data of remote tables

正解: B

解説:

The "Validate Remote Tables" feature in the SAP Datasphere repository explorer is primarily used to identify structure updates of the remote sources. When a remote table is created in Datasphere, it establishes a metadata connection to a table or view in an external source system. Over time, the structure of the source object (e.g., column additions, deletions, data type changes) might change. The "Validate Remote Tables" function allows you to compare the metadata currently stored in Datasphere for the remote table with the actual, current metadata in the source system. If discrepancies are found, Datasphere can highlight these structural changes, prompting you to update the remote table's definition within Datasphere to match the source. This ensures that views and data flows built on these remote tables continue to function correctly and align with the underlying source structure, preventing data access issues or incorrect data interpretations.

#### 質問 # 18

Which programming language is used for scripting in an SAP Analytics Cloud story?

- A. ABAP
- B. Wrangling Expression Language
- **C. JavaScript**
- D. Python

正解: C

解説:

JavaScript is the programming language utilized for scripting within an SAP Analytics Cloud (SAC) story. While SAC offers various functionalities through its intuitive user interface, scripting with JavaScript provides advanced capabilities for customizing the behavior and interactivity of a story. This allows developers and power users to create highly tailored analytical applications and dashboards that go beyond standard features. For instance, JavaScript can be used to dynamically change chart properties, implement complex filtering logic, trigger data actions, or integrate with external services. Unlike analytic applications, which typically offer more extensive scripting options, storytelling in SAC focuses on enabling business users to create interactive reports with a degree of customization through embedded scripts. The scripts are executed by the web browser, leveraging its built-in JavaScript execution engine, ensuring a flexible and widely understood development environment for enhancing story functionality.
