- A. /var/info/
- B. /etc/defaults/
- C. /usr/examples/
- D. /doc/
- E. /usr/share/doc/

**Answer: E**

Explanation:

Explanation/Reference:

### NEW QUESTION # 14

Which of the following outputs comes from the command free?

- A. 

Filesystem	Size	Used	Avail	Use%	Mounted on
/dev/mapper/vg_ssdb-root	25G	20G	3.6G	85%	/
- B. 

avg-cpu:	%user	%nice	%system	%iowait	%steal	%idle
	34.04	0.03	13.88	1.06	0.00	50.99
- C. 

avg-cpu:	%user	%nice	%system	%iowait	%steal	%idle
	34.04	0.03	13.88	1.06	0.00	50.99
- D. 

avg-cpu:	%user	%nice	%system	%iowait	%steal	%idle
	34.04	0.03	13.88	1.06	0.00	50.99
- E. 

	total	used	free	shared	buff/cache	available
Mem:	16123128	12565680	2011624	412128	1545824	7180416

**Answer: E**

### NEW QUESTION # 15

Which of the following commands shows the absolute path to the current working directory?

- A. ls -l
- B. cd ~/home
- C. cd ..
- D. who
- E. pwd

**Answer: E**

Explanation:

The command pwd stands for "print working directory". It will print the absolute path of the current working directory to the terminal. For example, if we are currently in the /home/user directory, it will print out that exact path1. The pwd command is useful

for finding out where we are in the file system hierarchy and for verifying the location of files and directories2.

The other options are not commands that show the absolute path to the current working directory. The who command shows the users who are currently logged in to the system3. The cd ... command changes the current working directory to the parent directory of the current one2. The ls -l command lists the files and directories in the current working directory in a long format, which shows the permissions, ownership, size, date, and name of each file and directory2. The cd ~/home command changes the current working directory to the /home directory under the user's home directory, which may or may not exist2. Reference:

## NEW QUESTION # 16

Which package management tool is used in Red Hat-based Linux Systems?

- A. rpm
- B. packagectl
- C. portage
- D. apt-get
- E. dpkg

**Answer: A**

Explanation:

RPM stands for RPM Package Manager (formerly known as Red Hat Package Manager), which is a powerful, command-line package management tool developed for the Red Hat operating system. It is now used as a core component in many Linux distributions such as CentOS, Fedora, Oracle Linux, openSUSE and Mageia1. RPM can install, uninstall, and query individual software packages, but it cannot manage dependency resolution like YUM2. YUM is another package management tool that is based on RPM and can handle dependencies automatically. YUM is the primary package management tool for installing, updating, removing, and managing software packages in Red Hat Enterprise Linux2. Therefore, the correct answer is B. rpm, as it is the underlying package management tool used in Red Hat-based Linux systems. Reference:
