### CompTIA A+ Certification Exam: Core 1 Sample Questions (Q63-Q68):

#### NEW QUESTION # 63

After a technician installs a new motherboard, the computer will not start and fails POST. The technician verifies the power supply is functioning as expected, and the CPU is installed correctly. Which of the following steps should the technician complete next?

- **A. Reseat the RAM.**
- B. Reinstall the old motherboard.
- C. Check the CMOS battery.
- D. Flash the BIOS.

**Answer: A**

Explanation:

A common reason for a POST failure after a motherboard installation is improperly seated RAM. The system requires working memory to successfully complete POST. Reseating (removing and reinserting) the RAM ensures it's making proper contact with the motherboard.

Option A: Flashing the BIOS is not possible if the system won't POST.

Option B: A dead CMOS battery can cause BIOS settings to reset, but it usually won't prevent POST entirely.

Option D: Reinstalling the old motherboard is premature - basic troubleshooting steps should be completed first.

#### NEW QUESTION # 65

A company uses vital legacy software that does not run in the current OS version Which of the following will best support the software while keeping the OS current?

- A. Application visualization
- B. Shared resources
- C. System sandbox

- D. Test development

**Answer: A**

Explanation:

Application virtualization allows legacy software to run in a virtualized environment while the operating system remains current. It isolates the application from the OS, ensuring compatibility without downgrading the OS.

Why Not A (Shared resources): This relates to resource sharing, not application compatibility.

Why Not B (System sandbox): Sandboxes isolate applications for security testing, not compatibility.

Why Not C (Test development): Test environments are used for development, not running legacy applications.

CompTIA A+ Exam Reference: Core 1 (220-1201), Section 4.2, virtualization concepts.

### NEW QUESTION # 66

Which of the following tools would a technician use to connect wires to an RJ45 connector?

- A. Loopback plug
- B. Punchdown
- **C. Crimper**
- D. Cable stripper

**Answer: C**

Explanation:

A crimper is specifically used to attach RJ45 connectors to the ends of network cables. It presses the connector pins into the cable's wires, establishing a secure electrical connection. A punchdown tool is used for wiring patch panels or keystone jacks, not for attaching connectors.

### NEW QUESTION # 67

A user's laptop is projecting an image upside down when connected to a ceiling-mounted projector. Which of the following should the technician do to best resolve the issue?

- **A. Flip the image vertically from the projector**
- B. Rotate the image from the laptop
- C. Adjust the display frequency
- D. Change the input source

**Answer: A**

Explanation:

Ceiling-mounted projectors are typically installed upside down, and therefore include a built-in "Ceiling Mount" or "Vertical Flip" setting within their display menu. CompTIA A+ emphasizes that projectors provide their own orientation controls intended specifically for this installation scenario. Adjusting orientation from the laptop rotates the desktop, not the projected output configuration. Changing input sources does not affect image orientation. Display frequency affects refresh rate and flickering, not physical image rotation.

Flipping the image directly from the projector ensures the display is oriented correctly regardless of the device connected. This is the method recommended in A+ material under display configuration and projector troubleshooting, which covers keystone correction, rotation, and mounting modes.

Thus, the correct solution is to flip the image vertically using the projector's built-in settings.
