NETA Level 2 Certified Assistant Electrical Testing Specialist Sample Questions (Q71-Q76):

NEW QUESTION # 71

Which voltage is recommended by NETA-ATS for a 15-minute AC withstand test on a three-phase 34.5 kV line sectionalizer rated for a 150 kV impulse withstand voltage?

- A. 69 kVAC
- B. 60 kVAC
- C. 78 kVAC
- D. 90 kVAC

Answer: C

Explanation:

NETA-ATS specifies withstand test voltages based on equipment rating and impulse withstand capability. For a 34.5 kV line sectionalizer with a 150 kV BIL, the recommended 15-minute AC withstand test voltage is 78 kVAC. NETA Level 2 technicians must apply the correct test voltage to avoid damaging insulation while still verifying dielectric integrity.

NEW QUESTION # 72

During primary current injection testing of a low-voltage circuit breaker, the breaker trips instantaneously at $8\times$ its long-time pickup setting, even though the instantaneous element is set to $10\times$. What is the MOST likely cause?

- A. Thermal memory enabled
- B. CT saturation
- C. Improper test lead placement
- D. Incorrect short-time delay setting

Answer: B

Explanation:

CT saturation occurs when the CT core cannot accurately reproduce high fault currents, causing distorted secondary current. This distortion can falsely trigger the instantaneous element at a lower current than expected. NETA Level 2 technicians must recognize CT saturation as a common cause of unexpected trip behavior during primary injection testing, particularly at high multiples of pickup.

NEW QUESTION # 73

Which lubricant is commonly specified for use in both conductive and mechanical areas of circuit breakers and switches?

- A. Graphite powder
- B. Mobil 28
- C. Silicone dielectric grease
- D. WD-40

Answer: B

Explanation:

Circuit breakers and switches include both current-carrying interfaces (where conductivity and contact integrity matter) and mechanical moving components (where friction, wear, and smooth operation matter).

NETA Level 2 objectives expect technicians to follow manufacturer guidance and industry-accepted practices for cleaning and lubrication during inspection and maintenance activities.

Mobil 28 is widely referenced in the industry for breaker and switch applications because it performs reliably over a broad temperature range and provides stable lubrication for mechanical parts while being used in certain conductive interfaces where specified. The key is that lubrication must match the component requirements: too much lubricant, the wrong type, or applying lubricant in inappropriate locations can attract contamination, increase resistance at contacts, or interfere with proper mechanism operation.

WD-40 is not an appropriate precision lubricant for breaker mechanisms. Graphite can be conductive and create unintended paths, and dielectric silicone greases are primarily intended for insulating/anti-moisture applications rather than general breaker conductive/mechanical lubrication unless specifically approved.

In NETA-style work, lubrication is not "generic"-it is controlled by procedure, manufacturer instructions, and the intended function of the surfaces involved.

NEW QUESTION # 74

How many connection points are typically found on a Kelvin bridge used for low-resistance measurements?

- A. 0
- B. 1
- C. 2
- D. 3

Answer: C

Explanation:

A Kelvin bridge, also known as a four-wire resistance measurement device, uses four connection points to accurately measure very low resistances. These consist of two current terminals and two potential (voltage) terminals.

This configuration eliminates the effects of lead resistance and contact resistance, which can significantly distort measurements when testing bolted connections, bus joints, and grounding conductors. NETA Level 2 technicians routinely use Kelvin methods when performing low-resistance ohmic measurements during acceptance and maintenance testing.

Using fewer than four terminals would result in inaccurate readings, especially at milliohm or micro-ohm levels. Understanding this principle ensures proper test setup and reliable data interpretation.

NEW QUESTION # 75

The data plate on a condenser bushing lists C2 values. What do these values represent?

- A. Power factor and capacitance between the tap and ground flange
- B. Total bushing capacitance under load
- C. Primary insulation capacitance to ground
- D. Secondary winding insulation resistance

Answer: A

Explanation:

C2 values represent the capacitance and power factor measured between the test tap and ground flange. These values are critical for evaluating bushing condition and detecting contamination, moisture ingress, or insulation deterioration during acceptance and maintenance testing.
