Salesforce Order Management Administrator Accredited Professional Sample Questions (Q79-Q84):

NEW QUESTION # 79
A company's Salesforce org has high-scale orders enabled. During a flash sale, a customer service representative needs to service an order but it shows as a Pending Order Summary in Salesforce.
What should the customer service representative do?

- A. Import the Order from the associated Account page
- B. The customer service representative has to wait until the Order Summary is created
- C. Manually create the Order Summary record
- D. Use the Create Order Summary action on the Order records actions menu

Answer: B

Explanation:
The best thing for the customer service representative to do in this situation is to wait until the Order Summary is created. An Order Summary is a record that represents the financial summary of an order that is received from an external system, such as B2C Commerce or B2B Commerce. An Order Summary is created after an order is ingested into Order Management, and it triggers various flows and processes for order fulfillment and payment processing. A Pending Order Summary is a temporary record that indicates that an order has been received but not yet processed by Order Management. A customer service representative cannot service an order until it has an Order Summary record. NEW QUESTION # 80

An administrator is running into performance issues due to a high number of records being created in a flow. How can the administrator modify the flow to improve scalability?

- A. Ask a developer to create a Flow apex action to offload the creation of records
- B. Ask a developer to offload all the Flow functionality to Apex code via Triggers and Apex classes
- C. Use the Bulk Create Records node in the Flow to improve performance
- D. Offload the creation of records to a Subflow that will be called in the Reference Flow

Answer: C

Explanation:
The best way for an administrator to modify the flow to improve scalability when running into performance issues due to a high number of records being created in a flow is to use the Bulk Create Records node in the Flow. This node allows the administrator to create multiple records of the same object type in one transaction, which reduces the number of database operations and improves the flow performance. Verified Reference: https://help.salesforce.com/s/articleView?id=sf.flow_ref_elements_data_bulk_create.htm&type=5

NEW QUESTION # 81

An administrator is creating a flow to manage order fulfillment The administrator creates a fault path to handle a possible error. What object record should the administrator create in the fault path to notify users of an error?

- A. Order Summary Exception
- B. Process Exception
- C. Fulfillment Error
- D. Order Error

Answer: B

Explanation:
Explanation
The object record that the administrator should create in the fault path to notify users of an error is Process Exception. A Process Exception is a record that represents an error or exception that occurred during the order lifecycle, such as payment authorization failure, inventory allocation failure, fulfillment location assignment failure, etc. A Process Exception has a lookup relationship to the Order object, and it contains information such as the exception type, status, message, etc. Verified References:https://help.salesforce.com/s/articleView?id=sf.order_management_process_exception.htm&type=5

NEW QUESTION # 82

What are two ways an administrator can query Order Summaries using APIs in Workbench?

- A. Invocable API
- B. Connect API
- C. Platform API
- D. Apex API
- E. Composite API

Answer: C,E

Explanation:

Two ways that an administrator can query Order Summaries using APIs in Workbench are:
Platform API. The Platform API is a set of REST and SOAP APIs that allow developers to access data and functionality in Salesforce from external systems. The Platform API includes various resources and operations for querying, creating, updating, or deleting records in Salesforce, such as Order Summaries. The administrator can use the Platform API in Workbench by selecting the REST Explorer or SOAP Explorer tabs, and entering the appropriate request URL and parameters.
Composite API. The Composite API is a type of REST API that allows developers to execute multiple subrequests in a single HTTP request. The Composite API includes various resources and operations for batching, tree, sObject collections, or transactions in Salesforce, such as Order Summaries. The administrator can use the Composite API in Workbench by selecting the REST Explorer tab, and entering the appropriate request URL and JSON body.

NEW QUESTION # 83
An admin is analyzing project requirements and notes that there are requirements to support both high volume and multiple locations.
What is the recommended approach for this scenario?

- A. Download the Single Location High Volume sample flow from the Partner Community and modify all the flows to loop through locations
- B. Download the Single Location High Volume sample flow from the Partner Community and have the developers add Apex code to enhance performance
- C. Download the Single Location High Volume sample flow and the Multiple Locations sample flow from the Partner Community and make a blend between the two considering trade-offs
- D. Download the Multiple Locations sample flow from the Partner Community and have developers add Apex code to enhance performance

Answer: C

Explanation:
The Single Location High Volume sample flow and the Multiple Locations sample flow are two examples of how to implement order fulfillment with Order Management. The Single Location High Volume sample flow is optimized for performance and scalability, but it only supports one fulfillment location per order. The Multiple Locations sample flow supports multiple fulfillment locations per order, but it has lower performance and scalability. To support both high volume and multiple locations, an admin can download both sample flows from the Partner Community and make a blend between them, considering trade-offs such as complexity, maintainability, and customizability.
