## Linux Foundation Certified GitOps Associate Sample Questions (Q45-Q50):

### NEW QUESTION # 45

In a GitOps-managed workflow, what is the correct way to initiate rollback?

- A. Overwrite your existing version with the code from your last working version.
- B. Create a new version based on a former version so you always "roll forward".

- C. Use Helm to rollback to a previous release version.
- D. Revert to an older version and force push to the main branch.

**Answer: B**

Explanation:

In GitOps, rollback is handled via version control. However, the practice is not to overwrite history but to roll forward by creating a new version that reverts to the configuration of a previous known-good commit. This maintains immutability and a complete audit trail.

"With GitOps, changes are versioned immutably. Rollbacks are performed by rolling forward to a commit that represents a previous known-good configuration, ensuring history is preserved." Thus, the correct GitOps approach is B.

#### NEW QUESTION # 46

You are working on a GitOps deployment and want to manage the configuration of your Kubernetes resources across multiple environments. How does Kustomize help?

- A. Kustomize helps you create and manage Kubernetes resource manifests by providing a graphical user interface (GUI).
- B. Kustomize allows you to package and distribute your application as a Helm chart.
- C. Kustomize helps you create and manage Kubernetes resource manifests by providing a way to customize them through patching.
- D. Kustomize is a tool for deploying infrastructure resources using Terraform/OpenTofu.

**Answer: C**

Explanation:

Kustomize is a Kubernetes-native configuration management tool that allows manifest customization without modifying the original YAML files. It uses overlays and patches to adapt configurations for different environments.

"Kustomize provides a declarative way to customize Kubernetes manifests by applying patches and overlays.

This allows managing multiple environments without duplicating manifest files." Thus, the correct answer is D.

#### NEW QUESTION # 47

You are implementing GitOps in your organization and have configured the Desired State of your applications in a Git repository. However, during the deployment process, you encounter an error in the configuration. What is the recommended action in this scenario?

- A. Make a call to the Kubernetes API with the correction.
- B. Raise a ticket with the development team to fix the error in the configuration file.
- C. Continue to monitor the issue and proceed with the deployment, as it may not significantly impact the application.
- D. Roll back the deployment to the previous working version while investigating the error in the configuration file.

**Answer: D**

Explanation:

GitOps emphasizes immutability and auditability. If an error occurs in the configuration stored in Git, the system should be rolled back to the last known good state while the error is fixed. This preserves system reliability and aligns with the GitOps principle of rollback through version control.

"With Git as the source of truth, if an error is introduced, the system can be rolled back by reverting to a previous commit. This ensures stability while the faulty configuration is corrected." Thus, the recommended action is C: Roll back to the previous working version.

References: GitOps Principles (CNCF GitOps Working Group).

#### NEW QUESTION # 48

Which of these Git commands will enact a rollback of the configuration to a previous commit?

- A. `git revert`
- B. `git commit`

- C. git push
- D. git branch

**Answer: A**

Explanation:

In GitOps, rollback is performed by reverting the system's Desired State stored in Git. This is done with the `git revert` command, which creates a new commit that undoes the changes introduced by a previous commit.

"Because Git provides an immutable history of changes, rollbacks are straightforward. Reverting to a previous configuration is accomplished by reverting the commit in Git, which then allows the reconciler to apply the earlier desired state." Thus, the correct answer is B: `git revert`.

#### NEW QUESTION # 49

In the context of GitOps, what does Continuous mean?

- A. Reconciliation must happen instantaneously.
- **B. Reconciliation continues to happen.**
- C. Reconciliation happens only during instantiation.
- D. Reconciliation only happens once.

**Answer: B**

Explanation:

One of the four core GitOps principles is that the system must be Continuously Reconciled. This means reconciliation is not a one-time or on-demand process but happens constantly in the background, ensuring the actual system state remains aligned with the declared desired state.

"GitOps requires that reconciliation is continuous. Software agents continuously compare actual state against desired state and automatically reconcile differences." Thus, the correct answer is C.
