

Pass Guaranteed 2026 Fantastic NCP-DB: Nutanix Certified Professional - Database Automation (NCP-DB) v6.5 High Quality

DOWNLOAD the newest PassCollection NCP-DB PDF dumps from Cloud Storage for free: <https://drive.google.com/open?id=156RX7QThkdNwTPbIZWkJZsYJwykFcT2>

If you are worried for preparation of your NCP-DB exam, so stop distressing about it because you have reached to the reliable source of your success. PassCollection is the ultimate solution to your all Nutanix Designing and Implementing Cloud Data Platform Solutions related problem. It provides you with a platform which enables you to clear your NCP-DB Exam. PassCollection provides you NCP-DB exam questions which is reliable and offers you a gateway to your destination.

Without bothering to stick to any formality, our NCP-DB learning quiz can be obtained within five minutes. No need to line up or queue up to get our NCP-DB practice materials. They are not only efficient on downloading aspect, but can expedite your process of review. No harangue is included within NCP-DB Training Materials and every page is written by our proficient experts with dedication. And we have demos of the NCP-DB study guide, you can free download before purchase.

Dump Nutanix NCP-DB Check - NCP-DB Vce Format

Most of the materials on the market do not have a free trial function. Even some of the physical books are sealed up and cannot be read before purchase. As a result, many students have bought materials that are not suitable for them and have wasted a lot of money. Especially for those students who are headaches when reading a book, NCP-DB study tool is their gospel. Because doing exercises will make it easier for one person to concentrate, and at the same time, in the process of conducting a mock examination to test yourself, seeing the improvement of yourself will makes you feel very fulfilled and have a stronger interest in learning. NCP-DB Guide Torrent makes your learning process not boring at all.

Nutanix Certified Professional - Database Automation (NCP-DB) v6.5 Sample Questions (Q234-Q239):

NEW QUESTION # 234

An administrator would like to use Era for Copy Data Management operations on an Availability Group (AG) database. The AG database is hosted on replicas with different named instances, as shown below:

- * SQLAGN1\EMR
- * SQLAGN2\EMR
- * SQLAGN3\DW

SQLAGN3\DW is running the Analytics service that needs real-time data. How should the administrator register the database in Era?

- A. Register the database as a Standalone database,
- B. Register the database as an Availability database.
- C. Register the SQLAGN3 from AG cluster and register the database as Availability database,

Answer: B

Explanation:

According to the Nutanix Database Automation (NCP-DB) learning documents, when dealing with an Availability Group (AG) database, the database should be registered as an Availability database1. This is because the AG database is hosted on replicas with different named instances, and registering it as an Availability database allows for Copy Data Management operations to be performed across all instances. This is particularly important when services such as the Analytics service running on SQLAGN3\DW require real-time data1.

NEW QUESTION # 235

Refer to the exhibit.

<input type="radio"/> bsmith	Super Admin	Local User
<input type="radio"/> bsmith@ntnxlab.local	Database Admin	AD Group

An administrator, whose accounts are shown in the exhibit, is trying to add a new database admin as a local user to NDB, but is unable to complete the task.

What is most likely the cause of the issue?

- A. An email address is required for the Super Admin account.
- B. Only users in the domain admins group can create local users.
- C. The administrator is logged in with the Database Admin account.
- D. The administrator is logged in with the Super Admin account.

Answer: C

Explanation:

Based on the exhibit, the administrator is logged in with the Database Admin account (bsmith@ntnxlab.local), which does not have the permission to create local users on NDB. Only the Super Admin account (bsmith) has this permission, as indicated by the User type column. Therefore, the administrator needs to log out and log in again with the Super Admin account to add a new database admin as a local user to NDB. NEW QUESTION # 236

An administrator needs to add a stretched VLAN across two clusters in NDB. Which two prerequisites should be met prior to completing this action? (Choose two.)

- A. VLAN must be static.
- B. Both clusters must be registered in NDB.
- C. VLAN must be IPAM.
- D. Nutanix Cluster Management must be enabled.

Answer: A,B

Explanation:

A stretched VLAN is a virtual network that spans across multiple Nutanix clusters and allows the communication between VMs on different clusters using the same subnet. A stretched VLAN can be used to provide high availability and load balancing for NDB components, such as HAProxy VMs, that require a virtual IP address (VIP) to be accessible from any cluster. To add a stretched VLAN across two clusters in NDB, the administrator needs to meet two prerequisites: the VLAN must be static and both clusters must be registered in NDB. A static VLAN is a VLAN that is manually created and configured by the administrator, as opposed to an IPAM VLAN that is automatically created and managed by NDB. A static VLAN can be added to a stretched VLAN in NDB,

while an IPAM VLAN cannot. Both clusters must be registered in NDB before adding a stretched VLAN, as NDB needs to have the information and access to the clusters and their networks.

The administrator can register the clusters in NDB using the Prism Element details, agent network configuration, and storage container information. The other option, Nutanix Cluster Management, is not a prerequisite for adding a stretched VLAN in NDB. Nutanix Cluster Management is a feature that allows the administrator to manage multiple Nutanix clusters from a single NDB UI, such as creating or deleting clusters, adding or removing nodes, or performing cluster operations. Nutanix Cluster Management is not required for adding a stretched VLAN, as the VLANs are created and configured in Prism Element, not in NDB. References:

NEW QUESTION # 237

An administrator needs to replace the default Nutanix self-signed certificates in Era.

Which SSL Certificate file format is supported?

- A. PKCS#12
- B. PKCS#7
- C. DER encoded binary X.509
- D. Base-64 encoded X.509

Answer: D

Explanation:

According to the Nutanix Database Automation (NCP-DB) learning documents, Nutanix Era supports x509 certificates in Base-64 encoded PEM format¹. This format is used when an administrator needs to replace the default Nutanix self-signed certificates in Era¹.

NEW QUESTION # 238

As administrator has been asked to add a database to a PostgreSQL instance already managed by NDB.

Which task should be performed?

- A. Add a new database to a source DB.
- B. Register a new DB VM to add the DB.
- C. Update a database clone to add a new DB.
- D. Provision a new DB server VM and add the new DB.

Answer: A

Explanation:

When an administrator is asked to add a database to a PostgreSQL instance already managed by NDB, the most appropriate task is to add a new database to the existing source database. In NDB, a PostgreSQL instance refers to a managed database server or cluster, and adding a new database involves creating it within the existing instance using NDB's database management capabilities. This can be done through the NDB GUI or CLI by selecting the source database and adding the new database, leveraging the current configuration and resources without requiring new VM provisioning.

- * Option A (Add a new database to a source DB) is correct as it directly addresses adding a database to an existing managed instance.
- * Option B (Register a new DB VM to add the DB) is incorrect because a new VM registration is unnecessary when the instance is already managed.
- * Option C (Provision a new DB server VM and add the new DB) is incorrect because provisioning a new VM is overkill for adding a database to an existing instance.
- * Option D (Update a database clone to add a new DB) is incorrect because clones are read-only copies, not suitable for adding new databases.

This approach ensures efficiency and leverages the existing NDB-managed infrastructure.
