

Quiz 2026 Valid Salesforce Analytics-Admn-201 Valid Dumps Sheet

P.S. Free 2026 Salesforce Analytics-Admn-201 dumps are available on Google Drive shared by Exam4Labs:
https://drive.google.com/open?id=1ydXD6TwXoneQBT-bnY_hskMkHsijbo1W

Perhaps you haven't heard of our company's brand yet, although we are becoming a leader of Analytics-Admn-201 exam questions in the industry. But it doesn't matter. It's never too late to know it from now on. Our Analytics-Admn-201 study guide may not be as famous as other brands for the time being, but we can assure you that we won't lose out on quality. We have free demos of our Analytics-Admn-201 Practice Engine that you can download before purchase, and you will be surprised to find its good quality.

Revision of your Analytics-Admn-201 exam learning is as essential as the preparation. For that purpose, Analytics-Admn-201 exam dumps contains specially created real exam like practice questions and answers. They are in fact meant to provide you the opportunity to revise your learning and overcome your Analytics-Admn-201 Exam fear by repeating the practice tests as many times as you can. Preparation for Analytics-Admn-201 exam using our Analytics-Admn-201 exam materials are sure to help you obtain your targeted percentage too.

Free Salesforce Analytics-Admn-201 Practice Exams - Exam Analytics-

Admn-201 Torrent

Although it is not an easy thing for somebody to pass the Analytics-Admn-201 exam, Exam4Labs can help aggressive people to achieve their goals. More qualified Analytics-Admn-201 certification for our future employment has the effect to be reckoned with, only to have enough qualification certifications to prove their ability, can we win over rivals in the social competition. This is the reason why we need to recognize the importance of getting our Analytics-Admn-201 Quiz torrent. And with our Analytics-Admn-201 exam questions, your dream will be easy to come true.

Salesforce Certified Tableau Server Administrator Sample Questions (Q42-Q47):

NEW QUESTION # 42

What command should you run to update the automatically-generated secrets that are created during a Tableau Server installation?

- A. tsm data-access caching set -r 1
- B. tsm licenses refresh
- **C. tsm security regenerate-internal-tokens**
- D. tsm security validate-asset-keys

Answer: C

Explanation:

Tableau Server uses internal secrets (tokens) for secure communication between its processes (e.g., Repository, File Store). These are automatically generated during installation and can be regenerated if compromised or for security maintenance. The command to update these is:

* tsm security regenerate-internal-tokens: This regenerates the internal security tokens, ensuring all processes use the new tokens after a restart.

* Option C (tsm security regenerate-internal-tokens): Correct. This is the documented command for updating internal secrets.

* Option A (tsm data-access caching set -r 1): Incorrect. This command configures caching behavior, not security tokens.

* Option B (tsm licenses refresh): Incorrect. This refreshes license data, unrelated to internal secrets.

* Option D (tsm security validate-asset-keys): Incorrect. This validates encryption keys for assets, not internal tokens.

Reference: Tableau Server Documentation - "Regenerate Internal Tokens" (https://help.tableau.com/current/server/en-us/cli_security.htm#regenerate-internal-tokens).

NEW QUESTION # 43

What Tableau Server authentication method should you configure to use OpenID Connect?

- A. Kerberos
- **B. SAML**
- C. Local Authentication
- D. Active Directory

Answer: B

Explanation:

Tableau Server supports multiple authentication methods, including Local Authentication, Active Directory, Kerberos, SAML, and OpenID Connect. OpenID Connect (OIDC) is an identity layer built on OAuth 2.0, commonly used for single sign-on (SSO). In Tableau Server, OIDC is implemented as a variant of SAML (Security Assertion Markup Language) authentication because both are SSO protocols managed through the same configuration workflow.

To use OpenID Connect:

* Configure Tableau Server for SAML/SSO.

* Provide an OIDC-compatible identity provider (IdP) configuration (e.g., Google, Okta).

* Set up the IdP metadata and certificates in TSM.

* Option D (SAML): Correct. Tableau Server treats OIDC as a subset of its SAML authentication framework, so you configure it under the SAML settings in TSM.

* Option A (Local Authentication): Incorrect. Local Authentication uses Tableau's internal user database, not an external SSO protocol like OIDC.

* Option B (Kerberos): Incorrect. Kerberos is a network authentication protocol for Windows environments, unrelated to OIDC.

* Option C (Active Directory): Incorrect. AD uses LDAP or Kerberos, not OIDC, for authentication.

Reference: Tableau Server Documentation - "Configure SAML and OpenID Connect" (https://help.tableau.com/current/server/en-us/saml_config.htm).

NEW QUESTION # 44

What command should you run to update the automatically-generated secrets that are created during a Tableau Server installation?

- A. tsm data-access caching set -r 1
- B. tsm licenses refresh
- C. tsm security regenerate-internal-tokens
- D. tsm security validate-asset-keys

Answer: C

Explanation:

Tableau Server uses internal secrets (tokens) for secure communication between its processes (e.g., Repository, File Store). These are automatically generated during installation and can be regenerated if compromised or for security maintenance. The command to update these is:

* tsm security regenerate-internal-tokens: This regenerates the internal security tokens, ensuring all processes use the new tokens after a restart.

* Option C (tsm security regenerate-internal-tokens): Correct. This is the documented command for updating internal secrets.

* Option A (tsm data-access caching set -r 1): Incorrect. This command configures caching behavior, not security tokens.

* Option B (tsm licenses refresh): Incorrect. This refreshes license data, unrelated to internal secrets.

* Option D (tsm security validate-asset-keys): Incorrect. This validates encryption keys for assets, not internal tokens.

Reference: Tableau Server Documentation - "Regenerate Internal Tokens" (https://help.tableau.com/current/server/en-us/cli_security.htm#regenerate-internal-tokens).

NEW QUESTION # 45

Which three types of authentications can be used with user-based licensing? (Choose three.)

- A. Active Directory
- B. Local authentication
- C. Trusted authentication
- D. Reliance authentication

Answer: A,B,C

Explanation:

Tableau Server's user-based licensing (Creator, Explorer, Viewer) ties licenses to individual users-let's determine compatible authentication methods:

* User-Based Licensing:

* Licenses are assigned per user, tracked by username.

* Authentication determines how users log in-must integrate with licensing.

* Option A (Local authentication): Correct.

* Details: Users are managed in Tableau Server's internal database-username/password set manually or via import.

* Why: Directly ties to user accounts, fully compatible with licensing.

* Option C (Trusted authentication): Correct.

* Details: Allows external apps to authenticate users via tickets (e.g., /trusted/<ticket>).

* Why: Maps to Tableau usernames, integrating with licensing-common for embedded analytics.

* Config: Trusted IPs or credentials set in TSM.

* Option D (Active Directory): Correct.

* Details: Uses AD for authentication (LDAP or Kerberos)-users sync to Tableau Server.

* Why: AD usernames align with licensing-supports SSO and user management.

* Config: Enable via tsm authentication active-directory configure.

* Option B (Reliance authentication): Incorrect.

* Why: Not a recognized Tableau authentication method-likely a typo (e.g., for "Resilience" or misheard term). No such feature exists.

Why This Matters: Authentication flexibility ensures user-based licensing fits diverse IT environments- critical for adoption.

Reference: Tableau Server Documentation - "Authentication" (https://help.tableau.com/current/server/en-us/auth_overview.htm), "Licensing Overview" (https://help.tableau.com/current/server/en-us/license_usage).

htm).

NEW QUESTION # 46

What statement correctly describes locking permissions to a project?

- **A. You can lock permissions to a project by changing Customizable to Locked**
- B. You can lock permissions to a project by setting the appropriate Project permission role
- C. Content permissions are locked to a project by default
- D. Locking permissions to projects must be enabled on the Tableau Server Settings page

Answer: A

Explanation:

In Tableau Server, projects organize content (workbooks, data sources) and use permissions to control access. "Locking permissions" restricts how permissions are managed within a project-let's explore this exhaustively:

* Permission Management Modes:

* Managed by Owner: Default mode. Content owners (e.g., workbook publishers) can set permissions on their items, inheriting project defaults as a starting point.

* Locked to the Project: Project-level permissions are enforced, and content owners cannot modify them. This ensures consistency across all items in the project.

* How to Lock:

* In the Tableau Server web UI:

* Go to Content > Projects.

* Select a project, click Actions > Permissions.

* In the Permissions dialog, change Permissions Management from "Customizable" (Managed by Owner) to "Locked."

* Set the desired permissions (e.g., Viewer, Editor) for users/groups, which then apply uniformly to all content.

* Via REST API: Use the updateProject endpoint with "permissionsLocked": true.

* Option B (You can lock permissions to a project by changing Customizable to Locked): Correct.

* Details: This is the precise action in the UI-switching from "Customizable" to "Locked" locks permissions at the project level.

* Impact: Owners lose the ability to override permissions on individual workbooks/data sources, enforcing governance.

* Example: Set "All Users" to Viewer (Locked)-all content in the project is view-only, regardless of owner intent.

* Option A (Locking permissions must be enabled on the Server Settings page): Incorrect.

* Why: Locking is a per-project setting, not a server-wide toggle. The Server Settings page (via TSM) controls global configs (e.g., authentication), not project permissions.

* Option C (Content permissions are locked by default): Incorrect.

* Default: New projects are "Managed by Owner" (Customizable), allowing flexibility unless explicitly locked by an admin.

* Option D (By setting the appropriate Project permission role): Incorrect.

* Confusion: "Project permission role" isn't a term-permissions are set via rules (e.g., Viewer, Editor), but locking is a separate action (Customizable # Locked).

Why This Matters: Locking permissions ensures uniform access control, critical for regulated environments or large teams where consistency trumps flexibility.

Reference: Tableau Server Documentation - "Lock Project Permissions" (https://help.tableau.com/current/server/en-us/permissions_lock.htm).

NEW QUESTION # 47

.....

All the IT professionals are familiar with the Salesforce Analytics-Admn-201 exam. And everyone dreams pass this demanding exam. Salesforce Analytics-Admn-201 exam certification is generally accepted as the highest level. Do you have it? About the so-called demanding, that is difficult to pass the exam. This does not matter, with the Exam4Labs's Salesforce Analytics-Admn-201 Exam Training materials in hand, you will pass the exam successfully. You feel the exam is demanding is because that you do not choose a good method. Select the Exam4Labs, then you will hold the hand of success, and never miss it.
