dbt Labs dbt Analytics Engineering Certification Exam Sample Questions (Q197-Q202):

NEW QUESTION # 197
You need to update a core configuration setting that impacts many models in your project. To mitigate risk, you want to deploy and

test these changes in a pre-production staging environment before rolling them out widely. How would you organize your work?

- A. Manually duplicate and modify the models in a dedicated staging schema, deploying with a separate dbt job.
- B. Use dbts --target flag to selectively execute models in staging and production environments.
- C. Write complex environment-aware macros to switch behavior dynamically, reducing code duplicatiom
- D. Create a feature branch, make changes, then test in staging by switching your profile.

Answer: D

Explanation:
A leverages version control best practices. B is tedious and error-prone. C is used at runtime, not for a staged rollout process. D increases complexity without much benefit here.

NEW QUESTION # 198
You frequently need to implement custom SQL tests that are very similar but with slight variations in parameters. Which dbt feature could streamline this process?

- A. dbt macros
- B. dbt seeds
- C. dbt snapshots
- D. The relationships test

Answer: A

Explanation:
Macros are ideal for parameterizing reusable test logic, making it easy to adapt the tests without excessive copy-pasting.

NEW QUESTION # 199
Examine the configuration for the source:
sources:
- name: jaffle_shop
schema: jaffle_shop_raw_current
tables:
- name: orders
identifier: customer_orders
Which reference to the source is correct?

- A. {{ source('jaffle_shop', 'orders') }}
- B. {{ source('jaffle_shop_raw_current', 'customer_orders') }}
- C. {{ source('jaffle_shop', 'customer_orders') }}
- D. {{ source('jaffle_shop_raw_current', 'orders') }}

Answer: A

Explanation:
In dbt, the source() function resolves a source by its declared source name and table name, not by the physical schema or identifier in the warehouse. The YAML block defines a source named jaffle_shop, and under that source, a table named orders. The identifier: customer_orders field tells dbt that although the logical table name is orders, the actual physical object in the warehouse is named customer_orders.
dbt always expects the syntax:
{{ source(source_name, table_name) }}
Here, the correct reference uses jaffle_shop as the source name and orders as the table name because these are the logical names assigned in the YAML. dbt internally resolves the physical table name via the identifier field, so the model should not reference customer_orders directly.
Option A and B are incorrect because the first argument is not the schema; dbt does not use schemas in the source() call. Option D is incorrect because customer_orders is the warehouse identifier, not the logical table name recognized by dbt.
Therefore, the correct reference is:
{{ source('jaffle_shop', 'orders') }}
This ensures consistent modeling, dependency tracking, and accurate documentation.

NEW QUESTION # 200

You discover that dbt models run significantly slower in your production environment than in development. What potential causes should you investigate?

- A. Inefficient use of snapshots or incremental models in your production dbt project_
- B. Network latency impactingressing access to remote data sources.
- C. Different database configurations or resource allocations (memory, CPU, etc.) between environments-
- D. Production data volume being significantly larger than development data.

Answer: B,C,D

Explanation:
Each of these directly affects performance and could differ significantly between environments. C is relevant, but less likely the sole cause if development is performant.

NEW QUESTION # 201

You have complex dbt models involving incremental logic based on a timestamp column. To debug a production issue, you want to temporarily force a full rebuild of a specific incremental model. Which dbt command-line options could help?

- A. Write a macro within the model to switch behavior based on an environment variable.
- B. Use dbt artifacts or the compilation context to access the current run's timestamp and override model logic.
- C. Manually update the timestamp column in the incremental model's output table.
- D. Add the -full-refresh flag to the dbt run command.

Answer: B,D

Explanation:
A overrides the incremental setting project-wide. C allows the model to be "tricked" into a full refresh. B is valid, but more work. D is risky and violates dbts workflow.
