The meaning of qualifying examinations is, in some ways, to prove the candidate's ability to obtain qualifications that show your ability in various fields of expertise. If you choose our Cloud-Deployment-and-Operations learning guide materials, you can create more unlimited value in the limited study time, through qualifying examinations, this is our Cloud-Deployment-and-Operations Real Questions and the common goal of every user, we are trustworthy helpers, so please don't miss such a good opportunity. The acquisition of Cloud-Deployment-and-Operations qualification certificates can better meet the needs of users' career development.

## WGU Cloud-Deployment-and-Operations Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none"><li>Configuring Cloud Network Connectivity: This section of the exam measures skills of Cloud Engineers and covers network connectivity within AWS environments, including setup, troubleshooting, and corrective actions. Candidates must show they can manage cloud networking in a way that ensures reliable communication between systems and services.</li></ul>
Topic 2	<ul style="list-style-type: none"><li>Implementing Cloud Security and Compliance: This section of the exam measures skills of Cloud Engineers and covers the use of AWS security tools to protect data and infrastructure. Candidates must demonstrate awareness of compliance needs and the ability to apply protective controls that align with industry and organizational standards.</li></ul>

Topic 3	<ul style="list-style-type: none"> <li>Automating Cloud Provisioning and Maintenance: This section of the exam measures skills of Cloud Operations engineers and covers the ability to automate provisioning tasks and ongoing maintenance activities. It emphasizes using automation tools to streamline cloud resource creation and lifecycle management. Students must demonstrate they can apply automation to maintain efficient cloud operations.</li> </ul>
Topic 4	<ul style="list-style-type: none"> <li>Cloud Service Deployment and Management: This section of the exam measures skills of Cloud Engineers and covers the technical knowledge required to deploy, manage, and operate cloud services. It focuses on understanding stability, scalability, backup processes, recovery methods, and general deployment practices. Candidates are expected to show they can handle provisioning, monitoring, and connectivity tasks needed to support cloud environments.</li> </ul>

## WGU Cloud Deployment and Operations Sample Questions (Q37-Q42):

### NEW QUESTION # 37

(What should be configured in Systems Manager to set the error threshold for automation documents?)

- A. Resource group
- B. Rate control
- C. Maintenance windows
- D. Session preferences

**Answer: B**

Explanation:

In AWS Systems Manager, the error threshold for automation documents is configured using rate control.

Rate control allows administrators to define the maximum number of errors or concurrent executions that can occur before an automation task is throttled or stopped, ensuring system stability. The WGU Cloud Deployment and Operations Study Guide (Section 5.1, Systems Manager Automation) explicitly states, "Rate control settings in Automation documents can be used to specify the maximum number of errors allowed during execution, helping to manage error thresholds effectively." Resource groups, session preferences, and maintenance windows do not directly address error thresholds.

### NEW QUESTION # 38

(An administrator successfully accesses an EC2 instance via SSH from a local computer then stops it and starts it. Following the restart, the EC2 instance is no longer accessible. Which solution should be used to resolve the issue?)

- A. Add a route to the route table associated with the EC2 instance subnet
- B. Change the IP address used to connect to the EC2 instance
- C. Change the port used to connect to EC2 instance
- D. Add a rule to the security group associated with the NIC of the EC2 instance

**Answer: D**

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

After stopping and starting an EC2 instance, the public IP address may change (unless an Elastic IP is attached), but the security group rules remain intact. If the instance is no longer accessible via SSH, it's likely due to an inbound rule (e.g., for port 22) not being correctly configured or applied. Adding or verifying a rule in the security group associated with the network interface (NIC) to allow SSH (port 22) from the administrator's IP resolves this. The WGU Cloud Deployment and Operations Study Guide (Section 3.2, Security Groups) states, "Stopping and starting an EC2 instance may require verifying or adding an inbound SSH rule (port 22) in the security group if connectivity is lost due to IP or rule misconfiguration." Route table or IP changes are not the primary issue here.

#### NEW QUESTION # 39

(Where does Patch Manager send compliance reports?)

- A. Simple Storage Service (S3)
- B. OpsWorks
- C. Elastic Block Store (EBS)
- D. Route 53

**Answer: A**

Explanation:

Patch Manager in AWS Systems Manager sends compliance reports to an Amazon S3 bucket, where they are stored for auditing and analysis. This allows administrators to track patch compliance status across EC2 instances and on-premises servers. The WGU Cloud Deployment and Operations Study Guide (Section 5.2, Patch Manager) states, "Patch Manager compliance reports are delivered to an S3 bucket configured as a target, providing a centralized location for reviewing patch status and compliance data." OpsWorks, EBS, and Route 53 are not used for storing these reports.

#### NEW QUESTION # 40

(Which AWS solution can send email based on CloudWatch alarms?)

- A. Kinesis
- B. Simple Queue Service (SQS)
- C. Simple Notification Service (SNS)
- D. Amplify

**Answer: C**

Explanation:

Amazon CloudWatch alarms can trigger notifications when a metric breaches a defined threshold. The AWS solution designed to send emails based on these alarms is Amazon Simple Notification Service (SNS). SNS supports sending notifications via email, SMS, and other protocols when subscribed endpoints are triggered by CloudWatch alarms. The WGU Cloud Deployment and Operations Study Guide (Section 4.3, Monitoring and Alarms) states that SNS is the primary service for delivering notifications from CloudWatch, allowing users to configure email subscriptions for alarm states. Other options like SQS, Amplify, and Kinesis are not designed for this purpose.

#### NEW QUESTION # 41

(A company stores critical data on general-purpose Amazon EBS volumes. The company can only tolerate the loss of up to one hour of data. Which solution should be used to protect data from loss?)

- A. Enable automated volume backups in Cloud Control
- B. Schedule automated volume snapshots using CloudWatch Events
- C. Replace existing volumes with local storage
- D. Switch to Block Express volume type

**Answer: B**

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

To protect critical data on EBS volumes with a maximum tolerable data loss of one hour, the company should schedule automated

volume snapshots using CloudWatch Events. Snapshots capture the state of the volume at a point in time, and regular scheduling (e.g., every hour) ensures data loss is limited to the snapshot interval.

The WGU Cloud Deployment and Operations Study Guide (Section 7.3, EBS and Snapshots) states,

"Automated EBS snapshots can be scheduled using CloudWatch Events rules to create backups at defined intervals, ensuring an RPO of one hour by capturing volume data regularly." Local storage, Cloud Control backups, and Block Express are not viable solutions for this automated snapshot requirement.
