## Palo Alto Networks XSOAR Engineer Sample Questions (Q130-Q135):

### NEW QUESTION # 130

A Cortex XSOAR Administrator is tasked with building a button for an analyst in order for the analyst to be assigned to the incident as an owner. What is the process?

- A. Edit the incident layout to add a new button that calls the AssignAnalystToIncident automation with no argument
- B. Edit the incident layout to add a new button that calls the AssignToMeButton automation with argument assignBy={me}
- C. Edit the incident layout to add a new button that calls the AssignAnalystToIncident automation with argument owner={me}
- D. Edit the incident layout to add a new button that calls the AssignAnalystToIncident automation with argument assignBy=current

**Answer: C**

### NEW QUESTION # 131

Within the playbook editor, which function allows a user to associate a task output to an incident field?.

- A. Classification.
- B. Inputs.
- C. Extend context.
- D. Mapping.

**Answer: C**

Explanation:

The XSOAR Playbook Editor allows engineers to manipulate and transform context data dynamically.

According to the XSOAR Admin and Playbook Development Guides, "Extend Context" is the dedicated mechanism that enables a task to save output values into new or existing context keys, including keys that correspond to incident fields. By defining a key under the "Extend Context" section, the playbook task can map specific outputs-such as JSON fields, strings, arrays, or nested objects-to a structured location within the incident context. These keys can then be used to populate incident fields through further playbook tasks, field mappings, or automated incident field updates.

Classification (option A) applies only during ingestion and cannot assign task outputs to incident fields. Inputs (option B) define what data a task receives, not how it is stored afterward. Mapping (option D) belongs to the ingestion pipeline and determines how event fields become incident fields during creation, not during playbook execution.

Therefore, Extend Context is the correct feature that allows a task to associate its output with incident fields, making option C the correct answer based on documentation.

### NEW QUESTION # 132

Where is a custom layout for an incident configured?.

- A. Integration instance settings.
- B. Pre-process rule.
- C. Incident playbook.
- D. Incident type.

**Answer: D**

### NEW QUESTION # 133

- A. Layouts can display incident information and custom fields
- B. New tabs can be added to the incident layout
- C. Layouts add or remove custom fields from an incident type

- D. Layouts override classification and mapping

**Answer: A,B**

### NEW QUESTION # 134
