Juniper Junos, Associate (JNCIA-Junos) Sample Questions (Q99-Q104):

NEW QUESTION # 99

You are asked to configure your device running Junos OS to automatically archive your configuration upon commit. In this scenario, which two methods are supported by the Junos OS? (Choose two)

- A. SCP
- B. RCP
- C. FTP
- D. HTTP

Answer: A,B

Explanation:

Junos OS supports multiple methods for automatically archiving configurations upon commit. Two of the supported methods are SCP (Secure Copy Protocol) and RCP (Remote Copy Protocol). These methods can be configured to save the configuration files to a remote server automatically whenever a commit is made.

NEW QUESTION # 100

An administrator configures a router's interface with an IPv4 address and subnet mask. The administrator also confirms that this interface is in an up state.

In this scenario, which two route types are created on the local router? (Choose two.)

- A. a dynamic route
- B. a local route
- C. a direct route
- D. a static route

Answer: B,C

Explanation:

When an interface on a router is configured with an IPv4 address and is in an up state, two types of routes are automatically created in the routing table: a local route and a direct route, making B and C the correct answers. The local route represents the interface's IP address itself, indicating that the router can directly receive packets addressed to this IP. The direct route represents the subnet or network segment to which the interface is connected, indicating that the router can directly forward packets to destinations within this subnet.

NEW QUESTION # 101

What is a benefit of using J-Web?

- A. It provides console-based management.
- B. It provides a customizable dashboard.
- C. It provides more advanced features than the CLI.
- D. It simultaneously manages multiple devices.

Answer: B

Explanation:

If you've committed a configuration and then need to revert to the previous configuration, the `rollback` command is used. Since the incorrect IP address has not been committed, as indicated by the `commit check` command being successful, issuing `rollback 1` will undo the changes made in the current session, which includes the accidental entry of the IP address.

NEW QUESTION # 102

After the factory default configuration is loaded, which configuration object must be created prior to the first commit?

- **A. root authentication**
- B. loopback IP address
- C. host name
- D. out-of-band connectivity

Answer: A

Explanation:

In Juniper Networks devices, when the factory default configuration is loaded, the first step before committing any configuration is to set up root authentication. This is crucial because it secures the device by ensuring that only authorized users have administrative access. Without setting up a root password, the device will not allow any commit operations, which is a safety measure to prevent unauthorized access. This requirement emphasizes the importance Juniper places on security right from the initial setup of the device.

NEW QUESTION # 103

You want to redeploy a Junos device by clearing the existing configuration and resetting it to factory defaults. In this scenario, which command would help to accomplish this task?

- A. request system storage cleanup
- **B. request system zeroize media**
- C. request system storage cleanup dry-run
- D. show system storage

Answer: B

Explanation:

The request system zeroize media command on a Junos device securely erases all data, including configuration and log files, and resets the device to its factory default settings. This command is used when redeploying a device to ensure no residual data remains from its previous deployment. It's a comprehensive and secure way to clear all configurations and data, making the device as if it were new. The other commands listed do not perform a full reset to factory defaults; for example, show system storage displays storage information, and request system storage cleanup offers to delete unnecessary files without resetting the device to factory settings.
