How can the Developer increase the Lambda compute resources?

- A. Increase the allocated memory for the Lambda function.
- B. Run on a larger instance size with more compute capacity.
- C. Increase the maximum execution time.
- D. Specify a larger compute capacity when calling the Lambda function.

Answer: D

NEW QUESTION # 225
A Developer has published an update to an application that is served to a global user base using Amazon CloudFront. After deploying the application, users are not able to see the updated changes.
How can the Developer resolve this issue?

- A. Disable forwarding of query strings and request headers from the CloudFront distribution configuration.
- B. Disable the CloudFront distribution and enable it again to update all the edge locations.
- C. Remove the origin from the CloudFront configuration and add it again.
- D. Invalidate all the application objects from the edge caches.

NEW QUESTION # 226
A Developer has implemented a Lambda function that needs to add new customers to an RDS database that is expected to run hundreds of times per hour. The Lambda function is configured to use 512MB of RAM and is based on the following pseudo code:

```
def lambda_handler(event, context):

db = database.connect()

db.statement('INSERT INTO Customers (CustomerName) VALUES
(context.name)')

db.close()
```

After testing the Lambda function, the Developer notices that the Lambda execution time is much longer than expected. What should the Developer do to improve performance?

- A. Increase the size of the RDS database to allow for an increased number of database connections each hour.
- B. Move the database connection and close statement out of the handler. Place the connection in the global space.
