

# Latest EMT Exam Cost | Reliable EMT Test Practice

## NYS EMT Practice Test exam 2024 with 100% correct answers

EMT training in nearly every state meets or exceeds the guidelines recommended by the:

- A) National Registry of EMTs
- B) individual state's EMS protocols
- C) National Association of EMTs
- D) National Highway Traffic Safety Administration (NHTSA) - correct answer
- D) National Highway Traffic Safety Administration (NHTSA)

While providing care to a patient, blood got onto the ambulance stretcher. Because the stretcher was not properly cleaned afterward, a virus was transmitted to another emergency medical technician (EMT) several days later. What route of transmission does this scenario describe?

- A) direct contact
- B) indirect contact
- C) airborne transmission
- D) vector-borne transmission - correct answer
- B) indirect contact

What type of stress reaction occurs when an EMT is exposed to many insignificant stressors over a period of several months or years?

- A) acute stress reaction
- B) cumulative stress reaction
- C) posttraumatic stress reaction
- D) critical incident stress reaction - correct answer
- B) cumulative stress reaction

To minimize the risk of litigation, the EMT should always:

- A) transport patients to the hospital of their choice
- B) provide competent care that meets current standards
- C) use universal precautions with every patient encounter

As we all know, in the highly competitive world, we have no choice but improve our soft power, such as EMT certification. You may be in a condition of changing a job, but having your own career is unbelievably hard. Then how to improve yourself and switch the impossible mission into possible is your priority. Here come our EMT Guide torrents giving you a helping hand. It is of great significance to have EMT question torrent to pass v exams as well as highlight your resume, thus helping you achieve success in your workplace.

## Following is the Test Prep EMT Exam Format

Format: Multiple choices, multiple answers

- Length of Examination: 120 minutes
- Passing score: 70%
- Language: English
- Number of Questions: 70-120

## Latest EMT Exam Cost - 100% Reliable Questions Pool

With our professional experts' unremitting efforts on the reform of our NREMT EMT guide materials, we can make sure that you can be focused and well-targeted in the shortest time when you are preparing a test, simplify complex and ambiguous contents. With the assistance of our NREMT EMT Study Guide you will be more distinctive than your fellow workers.

### Test Prep EMT Exam Introduction

The National Register Emergency Medical Technician (EMT) cognitive test is a computer adaptive test (CAT). This means that each candidate is evaluated based on the position of the responses on a spectrum. Once a candidate gets the correct answers, the computer will automatically enter more difficult questions to continue testing the candidate's skill level. The number of items a candidate can expect from the EMT exam will be between 70 and 120. Each exam will have between 60 and 110 "live" elements that will be counted towards the final score. The exam will also include 10 pilot questions that do not affect the final score. The maximum time allowed to complete the exam is 2 hours. To pass the exam, candidates must meet a standard skill level. The standard of success is defined by the ability to provide safe and effective entry-level emergency medical care.

### NREMT Emergency Medical Technicians Exam Sample Questions (Q14-Q19):

#### NEW QUESTION # 14

You have achieved ROSC (Return of Spontaneous Circulation) in a 77-year-old female. She remains unresponsive and her vital signs are BP 94/58, P 82, and R 18. In what position should she be placed?

- A. Left lateral recumbent
- B. Trendelenburg
- C. Supine
- D. Head elevated 45°

**Answer: A**

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

After ROSC in an unresponsive patient, the left lateral recumbent position (also called the recovery position) is preferred to:

- \* Maintain an open airway
- \* Prevent aspiration if vomiting occurs
- \* Promote drainage of secretions

Supine or Trendelenburg positions increase the risk of aspiration. Elevating the head to 45° may reduce intracranial pressure, but it's not standard post-ROSC care in an unresponsive patient unless airway protection is ensured.

#### NEW QUESTION # 15

A 21-year-old patient is nauseous and actively vomiting. The patient has a sweet odor on the breath. The skin is warm, flushed, and dry. The patient is breathing at 40/min. What should the EMT most strongly suspect is the cause of the patient's condition?

- A. Hypoglycemia
- B. Diabetic ketoacidosis
- C. Hyperosmolar hyperglycemic syndrome
- D. Toxic ingestion

**Answer: B**

Explanation:

The correct answer is B. Diabetic ketoacidosis (DKA).

This question is testing recognition of classic signs of DKA, a life-threatening complication of diabetes characterized by hyperglycemia, ketosis, and metabolic acidosis.

The patient presents with hallmark findings:

- \* Sweet/fruity odor on the breath # caused by ketones (acetone)
- \* Nausea and vomiting # common in DKA
- \* Warm, flushed, dry skin # due to dehydration
- \* Rapid breathing (40/min) # Kussmaul respirations (deep, rapid breathing to compensate for acidosis) According to NREMT-aligned EMT educational material:
- \* "Patients with diabetic ketoacidosis often have a fruity odor on their breath."
- \* "Kussmaul respirations are deep and rapid breathing seen in metabolic acidosis."
- \* "DKA presents with dehydration, vomiting, and altered respiratory patterns." Why the other options are incorrect:
- \* A. Hyperosmolar hyperglycemic syndrome (HHS):Typically occurs in older patients and does not produce ketones, so no fruity breath odor.
- \* C. Toxic ingestion:Can cause vomiting, but does not classically produce fruity breath and Kussmaul respirations together.
- \* D. Hypoglycemia:Usually presents with cool, clammy skin, altered mental status, and normal or shallow respirations-not fruity breath or deep rapid breathing.

Key NREMT Concept:

- \* "Fruity breath odor + rapid deep respirations = Diabetic ketoacidosis." Exact Extracts:
- \* "A fruity odor on the breath is a sign of ketoacidosis."
- \* "Kussmaul respirations are deep, rapid respirations associated with acidosis."
- \* "DKA patients are often dehydrated with warm, dry skin."

### NEW QUESTION # 16

A 6-year-old female rode her bicycle into a parked car. She is in moderate respiratory distress and you palpate subcutaneous emphysema. Of the following, what is the most important management for her?

- A. Stabilizing her chest
- B. Securing her to a long backboard
- C. Transporting her rapidly
- **D. Assisting her ventilations with a BVM**

**Answer: D**

Explanation:

Subcutaneous emphysema following blunt chest trauma strongly suggests air leaking from the lung into surrounding tissues, often associated with pneumothorax. NREMT trauma priorities stress that airway and breathing take precedence over all other interventions.

Option D is correct because the child is already in moderate respiratory distress, indicating inadequate ventilation. Assisting ventilations with a BVM ensures oxygen delivery and adequate tidal volume while preparing for rapid transport.

Option A is important but does not address the immediate life threat.

Option B may help with pain or flail segments but does not correct ventilation.

Option C is no longer routinely indicated and does not address breathing.

NREMT emphasizes correcting life-threatening airway and breathing problems before movement or transport.

### NEW QUESTION # 17

An unresponsive 79-year-old female has agonal respirations. You should

- A. Open her airway and ventilate her with a BVM
- B. Begin chest compressions
- C. Open her airway and suction until clear
- **D. Check for a pulse**

**Answer: D**

Explanation:

Agonal respirations are not effective breathing and can mimic gasping or snorting. They often occur in cardiac arrest. However, before initiating chest compressions, the EMT must confirm pulselessness by checking a carotid pulse for no more than 10 seconds (AHA 2020 BLS Guidelines).

Only after pulse confirmation (or absence) should compressions begin. Suctioning or ventilating is premature unless a pulse is found.

### NEW QUESTION # 18

Which of the following is an example of secondary prevention?

- A. Administering vaccinations
- B. Performing equipment maintenance
- C. Controlling access to addictive substances
- D. Educating the public on naloxone usage

**Answer: D**

Explanation:

Comprehensive and Detailed Explanation (Based on NREMT standards):

NREMT defines secondary prevention as actions taken to reduce the impact of a disease or injury after it has occurred, focusing on early intervention and harm reduction.

Option D is correct because educating the public on naloxone use does not prevent opioid addiction but reduces morbidity and mortality by reversing overdoses when they occur.

Option A and C are examples of primary prevention, which aim to prevent disease before it happens.

Option B is an operational task, not prevention.

NREMT emphasizes prevention roles as part of community paramedicine and public health integration.
