최신 CCRN-Adult시험대비 덤프자료 시험대비 공부문제

ExamPassdump는 오래된 IT인증 시험덤프를 제공해드리는 전문적인 사이트입니다. ExamPassdump의 AACN인증 CCRN-Adult덤프는 업계에서 널리 알려진 최고품질의 AACN인증 CCRN-Adult시험대비자료입니다. AACN인증 CCRN-Adult덤프는 최신 시험문제의 시험범위를 커버하고 최신 시험문제유형을 포함하고 있어 시험패스율이 거의 100%입니다. ExamPassdump의 AACN인증 CCRN-Adult덤프를 구매하시면 밝은 미래가 보입니다.

AACN CCRN-Adult 시험요강:

주제	소개
주제 1	The endocrine, hematology, gastrointestinal, renal, and integumentary domains are also covered, focusing on conditions like diabetes mellitus, acute kidney injury, and infections. This section highlights the need for nurses to manage complex patient scenarios involving multiple systems effectively.
주제 2	In musculoskeletal, neurological, and psychosocial areas, the syllabus includes managing trauma, neurological disorders, and behavioral health issues. This emphasizes the holistic approach required in critical care settings. Lastly, multisystem complications such as sepsis and shock states are included to assess the ability to manage life-threatening conditions that affect multiple organ systems.
주제 7	Facilitation of learning is emphasized, indicating the role of nurses in educating patients and families about health management. Collaboration is another key component, focusing on teamwork within healthcare settings to improve patient outcomes. Systems thinking is included to encourage understanding of how different components of healthcare interact. Finally, clinical inquiry is highlighted as a means to foster evidence-based practice and continuous improvement in patient care.
주제 8	PROFESSIONAL CARING & ETHICAL PRACTICE: This section assesses the skills of Clinical Nurse Leaders in professional caring and ethical practice. It covers advocacy and moral agency, highlighting the importance of representing patients' interests in healthcare decisions. The section also addresses caring practices that promote patient-centered care and response to diversity, ensuring that care is tailored to individual needs.

최신 AACN CCRN CCRN-Adult 무료샘플문제 (Q552-Q557):

질문 # 552

The nurse is caring for a newly admitted patient with worsening chronic heart failure. The nurse notes on the patient's EKG strip that the P wave in lead II is > 0.13 seconds and > 3.2 mm.

The nurse knows that these findings MOST LIKELY indicate:

- A. Ventricular hypotrophy
- B. Atrial hypertrophy
- C. Ventricular hypertrophy
- D. Atrial hypotrophy

정답: B

설명:

The P wave represents atrial muscle depolarization. It is normally 2.5 mm or less in height and 0.11 seconds or less in duration. The P wave morphology, which is smooth and rounded, can reveal right or left atrial hypertrophy or atrial arrhythmias and is best determined in leads II and V1 during sinus rhythm.

Patient's EKG Findings Normal EKG Findings

> 3.2 mm ≤ 2.5 mm

> 0.13 seconds ≤ 0.11 seconds

질문 # 553

A patient with a C5 spinal cord injury calls the nurse every 15 minutes with requests for juice, water, and repositioning. Which of the following is the nurse's best response?

- A. "You need to be repositioned only every 2 hours."
- B. "I will get someone to sit with you."
- C. "You are safe. Nothing will happen to you."
- D. "I will check on you every 30 minutes."

정답: B

설명:

Spinal cord injury

The patient with a C5 spinal cord injury may have anxiety, fear, or depression due to the loss of function and independence. The patient may also have difficulty breathing, swallowing, or regulating body temperature.

The patient may call the nurse frequently to seek reassurance, attention, or comfort. The nurse should respond with empathy and compassion, and provide the patient with emotional support and psychological counseling.

The nurse should also assess the patient's physical needs and provide adequate hydration, nutrition, and skin care. The nurse should not dismiss the patient's requests, ignore the patient's feelings, or limit the patient's contact with the nurse. The nurse should also not give false reassurance or minimize the patient's concerns.

Therefore, the best response is to get someone to sit with the patient, such as a family member, a friend, or a volunteer. This will help the patient feel less isolated, anxious, or depressed, and provide the patient with a sense of security and companionship.

질문 # 554

Of the distributive shock syndromes, which of the following is MOST commonly seen in critically ill patients?

- A. Septic shock
- B. Neurogenic shock
- C. Anaphylactic shock
- D. Hypovolemic shock

정답: A

설명:

There are three types of shock:

- * Hypovolemic
- * Cardiogenic
- * Distributive

Distributive shock is an abnormal placement or distribution of vascular volume, occurring in three situations:

1. Septic shock
2. Neurologic damage
3. Anaphylaxis

In the critical care setting, septic shock (one of the types of distributive shock syndromes) is most commonly seen. In the field or emergency department settings, anaphylaxis and neurogenic shock are common and typically result from allergic reactions and trauma-related spinal cord injury.

질문 # 555

What is the preferred vasopressor in severe sepsis and septic shock?

- A. Epinephrine
- B. Dopamine
- C. Norepinephrine
- D. Phenylephrine

정답: C

설명:

Norepinephrine is the vasopressor of choice and the first-line designation for severe sepsis and septic shock, according to the 2016 SSC guidelines.

Dopamine is recommended as an alternative vasopressor agent to norepinephrine only in highly selected patients. Its use is limited due to tachyarrhythmia concerns.

Epinephrine's use is reserved for when other vasoconstrictors are inadequate. It is used in patients whose hypotension is refractory to norepinephrine.

Phenylephrine is not recommended in the treatment of septic shock, except in the following circumstances: norepinephrine is associated with serious arrhythmias, cardiac output is known to be high and BP persistently low, or as salvage therapy when combined inotrope/vasopressor drugs and low-dose vasopressin have failed to achieve the MAP target of 65 mm Hg.

질문 # 556

Which of the following is used to screen for congenital coagulation disorders and for monitoring anticoagulation with unfractionated (IV) heparin therapy?

- A. Activated Coagulation Time (ACT)
- B. Activated partial thromboplastin time (aPTT)
- C. Vitamin K levels
- D. Prothrombin Time (PT)

정답: B

설명:

The activated partial thromboplastin time (aPTT) is reported in seconds and is used to evaluate fibrin clot formation stimulated by the intrinsic and common pathways of coagulation. This test is used to screen for congenital coagulation disorders and for monitoring anticoagulation with unfractionated (IV) heparin therapy.

Activated Coagulation Time (ACT) is reported in seconds and is used most commonly to monitor effects of unfractionated heparin during and following cardiovascular procedures such as cardiopulmonary bypass and percutaneous coronary interventions.

Prothrombin Time (PT) evaluates the extrinsic pathway and final common pathway of fibrin clot formation.

Vitamin K levels are not used to evaluate for congenital coagulation disorders or for monitoring anticoagulation.

질문 # 557
