RUCKUS Certified Networking Implementer Sample Questions (Q51-Q56):

NEW QUESTION # 51

At which prompt can the ping command be executed?

- A. ICX7150-C12 Router(config-if-e1000-1/1/1)#
- **B. ICX7150-C12 Router#**
- C. ICX7150-C12 Router(config-if-mgmt-1)#
- D. ICX7150-C12 Router(config)#

Answer: B

Explanation:

* Understanding CLI Levels:

* The ping command is used to test connectivity to other devices by sending ICMP echo requests.

* It can only be executed from the privileged EXEC mode, which is indicated by the Router# prompt.

* Why Other Prompts Don't Work:

* A. Router(config-if-mgmt-1)#: This is the interface configuration mode for the management port and does not allow execution of diagnostic commands like ping.

* B. Router(config)#: This is the global configuration mode, which is used to configure the switch but does not support diagnostic commands.

* D. Router(config-if-e1000-1/1/1)#: This is the interface configuration mode for Ethernet 1/1/1, which also does not allow execution of ping.

NEW QUESTION # 53

Which statement is true about Secure Shell (SSH) functionality in FastIron 08.0.95?

- **A. Server function is disabled by default.**
- B. Default login timeout is 30 seconds.
- C. Default SSH authentication type is RSA with 2048-bit modulus.
- D. Outbound SSH sessions are not supported.

Answer: A

Explanation:

In RUCKUS FastIron software version 08.0.95, the Secure Shell (SSH) server functionality is disabled by default for security reasons. This means that, out of the box, the device will not accept incoming SSH connections until the SSH server is explicitly enabled by the administrator.

To enable the SSH server on a RUCKUS ICX device, follow these steps:

* Access Global Configuration Mode:

enable

configure terminal

* Enable the SSH Server:

crypto key generate rsa

ip ssh server enable

* The crypto key generate rsa command generates the RSA key pair necessary for SSH encryption.

* The ip ssh server enable command starts the SSH server, allowing the device to accept incoming SSH connections.

* Save the Configuration:

write memory

This ensures that the SSH server remains enabled after a reboot.

It's important to note that while the SSH server is disabled by default, the SSH client functionality is enabled, allowing the device to initiate outbound SSH
