Salesforce Certified MuleSoft Integration Foundations Sample Questions (Q35-Q40):

NEW QUESTION # 35

According to MuleSoft, which deployment characteristic applies to a microservices application architecture?

- A. Core business capabilities are encapsulated in a single, deployable application

- B. A deployment to enhance one capability requires a redeployment of all capabilities
- C. All services of an application can be deployed together as single Java WAR file
- D. Services exist as independent deployment artifacts and can be scaled independently of other services

Answer: D

Explanation:

Microservices Architecture: This approach structures an application as a collection of loosely coupled services¹⁰.

Independent Scalability: A defining characteristic is that each microservice is a separate deployment unit. If one service (e.g., "Order Processing") receives high load, you can scale only that service without having to scale the entire application¹¹.

Independent Deployment: You can update and redeploy a single microservice without impacting or redeploying the others.

Why others are incorrect:

Single Java WAR / Single deployable application (A, B): These describe a Monolithic architecture¹².

Redeployment of all (D): This is a major downside of Monoliths, not Microservices¹³.

NEW QUESTION # 36

Which Anypoint Platform component helps integration developers discover and share reusable APIs, connectors, and templates?

- A. Anypoint Studio
- B. Anypoint Exchange
- C. Design Center
- D. API Manager

Answer: B

Explanation:

Anypoint Exchange: This is the "marketplace" or central repository of the Anypoint Platform¹⁴¹⁴¹⁴¹⁴.

Discovery & Reuse: Its primary purpose is to allow developers to publish their assets (APIs, Connectors, Templates) so that other developers can find ("discover") and reuse them. This drives the efficiency of the API-led connectivity model¹⁵.

Why others are incorrect:

Anypoint Studio: The IDE for building applications¹⁶.

API Manager: For governing and securing running APIs¹⁷.

Design Center: For designing API specifications and flows¹⁸.

NEW QUESTION # 37

An application load balancer routes requests to a RESTful web API secured by Anypoint Flex Gateway.

- A. SFTP
- B. HTTPS
- C. SMTP
- D. LDAP

Answer: B

Explanation:

RESTful APIs: By definition, REST relies on the HTTP protocol (Hypertext Transfer Protocol).

Security: When an API is "secured," it almost universally implies the use of TLS/SSL encryption, turning HTTP into HTTPS.

Load Balancers: Application Load Balancers (ALBs) operate at Layer 7 (Application Layer) and are designed to route HTTP/HTTPS traffic.

Why others are incorrect:

SMTP: Simple Mail Transfer Protocol (Email).

SFTP: Secure File Transfer Protocol (Files).

LDAP: Lightweight Directory Access Protocol (Identity/User lookup).

None of these are used for standard REST API routing.

NEW QUESTION # 38

An integration team follows MuleSoft's recommended approach to full lifecycle API development. 9

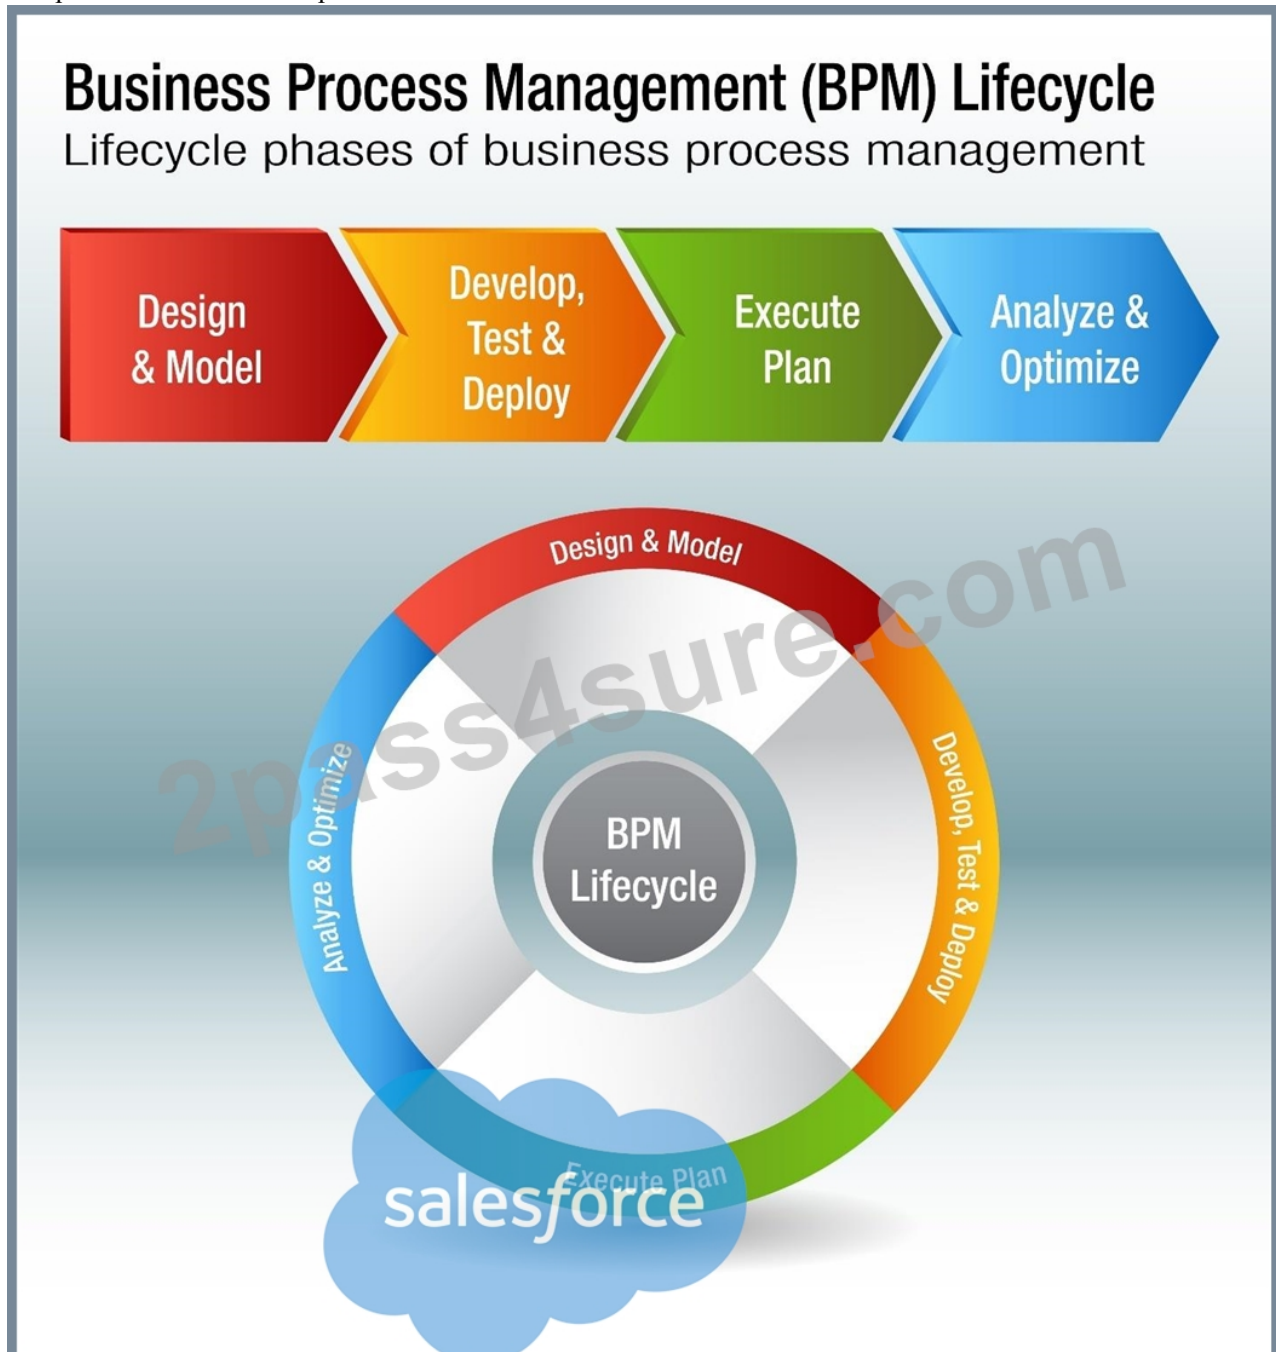

- A. Use the API specification to build the MuleSoft application
- B. Use the API specification to monitor the MuleSoft application
- C. Validate the API specification
- D. Design the API specification

Answer: A

Explanation:

(Note: The question implies "What is the next step after design/validation?" or "How is the spec used?". Based on the answer key A, the context is how the spec drives development).

API-Led Connectivity & Design-First: MuleSoft promotes a "Design-First" approach. You first write the RAML or OAS specification.

MuleSoft scaffolding: Once the specification is designed and published to Exchange, the developer imports it into Anypoint Studio. Studio then scaffolds (automatically generates) the Mule flows based on the API Specification.

The Workflow:

Design: Create the API contract (RAML/OAS).

Publish: Publish to Exchange.

Build (Answer A): Use the API specification to generate the flow structure (APIkit Router) and implement the logic. This ensures the implementation strictly matches the design defined in the earlier phases.

NEW QUESTION # 39

According to MuleSoft's IT delivery and operating model, which approach can an organization adopt in order to reduce the frequency of IT project delivery failures?

- A. Stop scope creep by centralizing requirements-gathering
- B. Prevent technology sprawl by reducing production of API assets
- C. Decouple central IT projects from the innovation that happens within each line of business
- D. Adopt an enterprise data model

Answer: C

Explanation:

The Problem (IT Delivery Gap): Traditional IT operating models often treat IT as a centralized factory, which becomes a bottleneck. The business demands change faster than Central IT can deliver, leading to project failures or delays.

The Solution (Decoupling): MuleSoft advocates for a new operating model (C4E) where Central IT produces reusable assets (System APIs) and then "gets out of the way." Innovation at the Edge: By decoupling core IT from the Line of Business (LOB), the LOB developers can self-serve those assets to build their own Process and Experience APIs. This allows innovation to happen in parallel across the organization, rather than waiting in a single queue, thus reducing failure rates associated with bottlenecks. 1111
