

C_S4EWM Examcollection Dumps - C_S4EWM Latest Exam Book

As most of the people tend to use express delivery to save time, our C_S4EWM preparation exam will be sent out within 5-10 minutes after purchasing. As long as you pay at our platform, we will deliver the relevant exam materials to your mailbox within the given time. Our company attaches great importance to overall services, if there is any problem about the delivery of C_S4EWM Exam Materials: SAP Certified - SAP S/4HANA Cloud Private Edition, Extended Warehouse Management, please let us know, a message or an email will be available.

SAP C_S4EWM Exam Syllabus Topics:

Section	Objectives
Topic 1: Internal Warehouse Processes	- Warehouse order management - Stock transfers and reposting
Topic 2: RF Framework and Mobile Data Entry	- Mobile execution of warehouse tasks - RF device configuration
Topic 3: Warehouse Monitoring and Exception Handling	- Exception handling and alerts - Warehouse management monitor
Topic 4: Extended Warehouse Management Overview	- Core warehouse management concepts - SAP EWM architecture and deployment options
Topic 5: Advanced Warehouse Management Features	- Wave management and labor management - Slotting and rearrangement
Topic 6: Inbound Processing	- Putaway strategies and warehouse task creation - Goods receipt and inbound delivery processing
Topic 7: Outbound Processing	- Picking and packing processes - Goods issue processing
Topic 8: Integration with SAP S/4HANA	- Embedded EWM processes - Integration with MM, SD, and TM modules

Free PDF Quiz 2026 C_S4EWM: SAP Certified - SAP S/4HANA Cloud Private Edition, Extended Warehouse Management High Hit-Rate Examcollection Dumps

Since the content of the examination is also updating daily, you will need real and latest SAP C_S4EWM Dumps to prepare successfully for the C_S4EWM Certification Exam in a short time. People who don't study from updated C_S4EWM questions fail the examination and lose time and money.

SAP Certified - SAP S/4HANA Cloud Private Edition, Extended Warehouse Management Sample Questions (Q177-Q182):

NEW QUESTION # 177

A regional paint distributor is validating a newly introduced exception-driven putaway path in SAP S/4HANA Extended Warehouse Management in a web-based mixed landscape. The customizing import into quality completed successfully after a scheduled maintenance cycle, and existing inbound and outbound test cases continue to run. During validation of the new path, however, the warehouse monitor shows the delivery item as warehouse-relevant, but the expected exception option is not available at the execution step for one warehouse number.

The same setup is visible in another warehouse used for comparison. The support team wants to avoid repeating the whole transport because the change window is closed and the affected warehouse is the only one still failing. The consultant must identify the most likely lifecycle-related dependency before proposing a broader corrective action.

Which action should the consultant take first?

Response:

- A. Create a separate test process for the failing warehouse so the missing option can be validated outside the current flow.
- B. Reverse the latest import and restore the earlier stable warehouse configuration before rechecking the exception path.
- C. Import the full customizing request so all warehouse-dependent settings are refreshed after the maintenance cycle.
- **D. Verify whether the new exception settings are active and correctly assigned to the specific warehouse context that still does not show them.**

Answer: D

Explanation:

Feedback:

The key evidence is selective behavior after a lifecycle event: the same setup is visible in one warehouse but not another, while the import itself succeeded and baseline flows still work. That points to a warehouse-specific activation or assignment dependency rather than a failed transport. The most targeted first step is to validate whether the exception settings are active and bound to the failing warehouse context.

NEW QUESTION # 178

CHALLENGE 5 2014; Shared Template Classification for Pharma Distribution Rollout The hypercare review shows that return routing relies on manual redirection, batch selection depends on user correction, and quarantine movements were completed with expanded resource coverage.

Which response is most appropriate?

Response:

- **A. Continue stabilization validation until quarantine routing, batch allocation, and resource-aligned execution are validated as repeatable system behavior.**
- B. Accept hypercare exit because each process can be completed with available operational workarounds.
- C. Move all returns and hospital orders back to the on-premise warehouse until every distribution center is live.
- D. Accept hypercare exit only if workarounds are documented as local operating instructions for the activated site.

Answer: A

Explanation:

Feedback:

The observations span returned-product routing, batch-sensitive allocation, and resource evidence. Hypercare exit should not be accepted until these dependencies are validated as repeatable system behavior rather than workaround behavior.

NEW QUESTION # 179

A consumer goods company transported new exception-handling settings into a quality tenant for SAP S/4HANA Extended Warehouse Management in a mixed deployment landscape. The import log shows successful completion, and existing inbound and outbound tests continue to run without interruption in the web-based environment. During a new putaway validation, however, the expected exception code is not available to warehouse users, even though the process step is the same one used during design review.

A project coordinator recommends immediately retransferring the entire request. Another team member suggests checking whether the transported settings were activated and assigned to the exact warehouse process context used in testing. The change window is short, so the consultant must choose the most targeted action before scheduling another transport.

Which action is the best next step?

Response:

- A. Verify that the transported exception settings are active and bound to the warehouse process context used in the test.
- B. Import the entire customizing request so all exception-related settings are refreshed together in quality.
- C. Reverse the import and restore the prior stable configuration before analyzing the missing exception behavior.
- D. Create a separate warehouse test process so the new exception handling can be validated without affecting current flows.

Answer: A

Explanation:

Feedback:

The transport imported successfully and existing flows still work, so the environment is not generally broken. The missing behavior is limited to the newly introduced exception handling in a specific execution context. That points to activation or assignment of customizing within the tested warehouse process rather than a failed import.

NEW QUESTION # 180

CHALLENGE 5 2014; Shared Template Classification for Fab-Spare Rollout The readiness review shows that calibration staging relies on manual path correction, direct module movement depends on user reassignment, and controlled movements were completed with broad resource coverage.

Which response is most appropriate?

Response:

- A. Accept cutover readiness because each process can be completed with available operational workarounds.
- B. Move all calibration-relevant parts and line-down requests back to the on-premise warehouse until every fab-spares warehouse is live.
- C. Continue readiness validation until calibration routing, direct movement eligibility, and resource-aligned execution are validated as repeatable system behavior.
- D. Accept cutover readiness only if workarounds are documented as local operating instructions for the pilot warehouse.

Answer: C

Explanation:

Feedback:

The observations span inbound routing, reservation-driven direct movement, and resource evidence. Cutover readiness should not be accepted until these dependencies are validated as repeatable system behavior rather than workaround behavior.

NEW QUESTION # 181

CHALLENGE 3 2014; Reservation-Driven Direct Movement for Replacement Modules A module creates a direct staging task only after a user changes the destination manually. The project lead asks whether this result can prove that reservation-driven direct movement is ready for cutover.

What is the most appropriate response?

Response:

- A. Yes, because the module reached the correct staging area and the production reservation was fulfilled.
- B. No, because the result must show that configured reservation eligibility created the direct movement without manual reassignment.
- C. Yes, if the manual destination change is documented in the receiving work instruction.
- D. No, because direct movement should never be used in a mixed private-edition and on-premise landscape.

Answer: B

Explanation:

Feedback:

The result proves that a user can complete the movement, not that the configuration triggered it. Cutover readiness requires evidence that reservation eligibility creates the direct movement without manual reassignment.

NEW QUESTION # 182

.....

The passing rate of our C_S4EWM study materials is the issue the client mostly care about and we can promise to the client that the passing rate of our product is 99% and the hit rate is also high. Our C_S4EWM practice braindumps are selected strictly based on the Real C_S4EWM Exam and refer to the exam papers in the past years. Our expert team devotes a lot of efforts on them and guarantees that each answer and question is useful and valuable.
