질문 # 79

Which component of an operating system allows the operating system to run applications?

- **A. Kernel**
- B. User interface
- C. File manager
- D. Driver

정답: A

설명:

The kernel is the core component of an operating system that enables applications to run by managing system resources and providing essential services. In Information Technology, applications do not directly control the CPU, memory, or hardware devices. Instead, they request services from the operating system through system calls, which are handled by the kernel. The kernel manages process creation and execution, memory allocation, multitasking, and communication between software and hardware. It also enforces protection and security boundaries so one program cannot easily interfere with another or with the operating system itself. The user interface affects how users interact with the system, but it is not the component that actually runs programs. The file manager handles organization and access to files, and drivers allow the operating system to communicate with specific hardware devices, such as printers and network cards. Because the kernel controls process execution and resource management, it is the operating system component that allows applications to run.

질문 # 80

Which IT department goal would support business goals?

- A. Interviewing applicants for marketing positions
- **B. Developing an online shopping cart for company products**
- C. Promoting the company's products and services
- D. Overseeing funds flowing through the organization

정답: B

설명:

IT goals directly support business goals when they enable or improve the core activities that generate revenue or growth. Here's why this option stands out:

*E-commerce Expansion: An online shopping cart directly facilitates sales, expanding the company's reach and providing customers with a convenient way to purchase products. This aligns with common business goals of increasing sales and market share.

질문 # 81

When would a business intelligence (BI) system be useful in making a decision?

- A. When determining the average salary of the company's executives
- **B. When deciding if a restaurant should use more organic food in its menu, based on customer reviews and an analysis of current costs**
- C. When figuring out when to reorder store inventory for a particular stock keeping unit (SKU)
- D. When deciding whether to promote an employee by looking at their annual sales performance

정답: B

설명:

A BI system shines in this scenario because it leverages the power of data from various sources and turns that into actionable insights:

*Customer Sentiment Analysis: BI systems can incorporate natural language processing to analyze customer reviews, gauging sentiment and preferences towards organic food. Trends and patterns can be identified.

*Cost Analysis: BI can pull in data on ingredient costs (organic vs. conventional), preparing a comprehensive analysis of how switching to more organic food would impact operational expenses.

*Decision Support: By combining customer sentiment, cost analysis, and potentially market trends (through external data integration), a BI system can provide a holistic view of the trade-offs and the potential impact of increasing organic food usage.

질문 # 82

Which piece of network equipment extends the cable range and allows connections to be made by increasing the signal strength?

- **A. Repeater**
- B. Switch
- C. Firewall
- D. Router

정답: A

설명:

A repeater extends cable range by regenerating or amplifying a signal so it can travel farther without degrading. In Information Technology networking, signals weaken over distance due to attenuation and interference. A repeater receives the incoming signal, cleans or reconstructs it, and then retransmits it at full strength. This allows network segments to exceed the normal maximum cable length limits for a given standard and helps maintain reliable communication. Repeaters are commonly associated with the physical layer of networking because they deal with signal transmission rather than packet routing or traffic decisions.

A switch operates mainly at the data link layer and forwards frames based on MAC addresses within a local network, but it does not primarily exist to boost signal strength. A router connects different networks and forwards packets using IP addressing and routing tables. A firewall is a security device that filters traffic based on rules to protect networks. Since the question focuses on increasing signal strength to extend range, the correct equipment is a repeater.

질문 # 83

What is an advantage of insourcing?

- A. The IT Department's responsibility is reduced.
- B. Developers gain experience when coding themselves.
- C. It is less expensive and faster to build.
- D. Training is minimal and does not take much commitment.

정답: B

설명:

Insourcing, the practice of developing software or handling IT tasks within the organization, offers several advantages. The primary advantage in this scenario focuses on skill development:

*Knowledge growth: By working directly on projects, in-house developers gain hands-on experience, enhancing their coding skills and understanding of the company's specific needs.

*Ownership: Insourcing provides developers with a sense of ownership over the project, often leading to increased motivation and problem-solving skills.
