You should also keep in mind that to get success in the Salesforce Mule-Arch-201 exam is not an easy task. The Salesforce Mule-Arch-201 certification exam always gives a tough time to their candidates. So you have to plan well and prepare yourself as per the recommended Mule-Arch-201 Exam study material.

The paper materials students buy on the market are often not able to reuse. After all the exercises have been done once, if you want to do it again you will need to buy it again. But with Mule-Arch-201 test question, you will not have this problem. All customers who purchased Mule-Arch-201 study tool can use the learning materials without restrictions, and there is no case of duplicate charges. For the PDF version of Mule-Arch-201 test question, you can print multiple times, practice multiple times, and repeatedly reinforce your unfamiliar knowledge. For the online version, unlike other materials that limit one person online, Mule-Arch-201 learning dumps does not limit the number of concurrent users and the number of online users. You can practice anytime, anywhere, practice repeatedly, practice with others, and even purchase together with others. Mule-Arch-201 learning dumps make every effort to help you save money and effort, so that you can pass the exam with the least cost.

Actual Mule-Arch-201 Exam Prep 100% Valid Test Questions are The Best Products

If you want to be a leader in some industry, you have to continuously expand your knowledge resource. Our BraindumpsVCE always updates the exam dumps and the content of our exam software in order to ensure the Mule-Arch-201 exam software that you have are the latest and comprehensive version. No matter which process you are preparing for Mule-Arch-201 Exam, our exam software will be your best helper. As the collection and analysis of our Mule-Arch-201 exam materials are finished by our experienced and capable IT elite.

Salesforce Certified MuleSoft Platform Architect Sample Questions (Q46-Q51):

NEW QUESTION # 46

An Order API triggers a sequence of other API calls to look up details of an order's items in a back-end inventory database. The Order API calls the OrderItems process API, which calls the Inventory system API. The Inventory system API performs database operations in the back-end inventory database.

The network connection between the Inventory system API and the database is known to be unreliable and hang at unpredictable times.

Where should a two-second timeout be configured in the API processing sequence so that the Order API never waits more than two seconds for a response from the OrderItems process API?

- A. In the Inventory system API implementation
- **B. In the OrderItems process API implementation**
- C. In the inventory database
- D. In the Order API implementation

Answer: B

Explanation:

Understanding the API Flow and Timeout Requirement:

The Order API initiates a call to the OrderItems process API, which in turn calls the Inventory system API to fetch details from the inventory database.

The requirement specifies that the Order API should not wait more than two seconds for a response from the OrderItems process API, even if there are delays further down the chain (between Inventory system API and the database).

Choosing the Appropriate Timeout Location:

Setting the timeout at the OrderItems process API level ensures that if the Inventory system API takes longer than two seconds to respond, the OrderItems process API will terminate the request and send a timeout response back to the Order API. This prevents the Order API from waiting indefinitely due to the unreliable connection to the database.

If the timeout were set in the Inventory system API or database, it would not help the Order API directly, as the OrderItems process API would still be waiting for a response.

Detailed Analysis of Each Option:

Option A (Correct Answer): Setting the timeout in the OrderItems process API allows it to control how long it waits for a response from the Inventory system API. If the Inventory system API does not respond within two seconds, the OrderItems process API can terminate the call and return a timeout response to the Order API, meeting the requirement.

Option B: Setting the timeout in the Order API would not limit the wait time at the OrderItems process API level, meaning the OrderItems process API could still wait indefinitely for the Inventory system API, leading to a longer delay.

Option C: Setting the timeout in the Inventory system API only affects the connection to the database and does not influence how long the OrderItems process API waits for the Inventory system API's response.

Option D: Setting a timeout in the database is not feasible in this context since database timeouts are typically configured for database operations and would not directly control the API response times in the overall API chain.

Conclusion:

Option A is the best choice, as it ensures that the OrderItems process API does not hold the Order API longer than the required two seconds, even if the downstream connection to the database hangs. This configuration aligns with MuleSoft best practices for setting timeouts in API orchestration to manage dependencies and prevent delays across a chain of API calls.

For additional information on timeout settings, refer to MuleSoft documentation on handling timeouts and API orchestration best practices.

NEW QUESTION # 47

An IT Security Compliance Auditor is assessing which nonfunctional requirements (NFRs) are already being implemented to meet security measures.

- * The Web API has Rate-Limiting SLA
- * Basic Authentication - LDAP
- * JSON Threat Protection
- * TP Allowlist policies applied

Which two NFRs-are enforced?

- A. The API invocations are coming from a known subnet range
- B. The API is protected against XML invocation attacks
- C. Username/password supported to validate login credentials
- D. Performance expectations are to be allowed up to 1,000 requests per second
- E. Sensitive data is masked to prevent compromising critical information

Answer: A,C

Explanation:

Understanding Nonfunctional Requirements (NFRs):

The NFRs in this context are related to security measures implemented for the Web API, such as rate limiting, LDAP-based authentication, JSON threat protection, and IP allowlist policies.

Evaluating the Options:

Option A (Correct Answer): The IP allowlist policy restricts access to known subnets, ensuring that API invocations come from a defined range of IPs.

Option B (Correct Answer): Basic Authentication with LDAP enforces a username/password validation, satisfying an NFR for identity verification.

Option C: Masking sensitive data is not part of the listed NFRs, as none of the mentioned policies address data masking.

Option D: XML threat protection is not mentioned, so this option is incorrect.

Option E: While rate-limiting implies performance control, it does not directly enforce a specific performance expectation.

Conclusion:

Options A and B are correct as they directly address the implemented security measures related to IP range restrictions and username/password authentication.

Refer to MuleSoft's documentation on API security policies for details on LDAP, rate limiting, and allowlist policies.

NEW QUESTION # 48

The asset version 2.0.0 of the Order API is successfully published in Exchange and configured in API Manager with the Autodiscovery API ID correctly linked to the API implementation. A new GET method is added to the existing API specification, and after updates, the asset version of the Order API is 2.0.1. What happens to the Autodiscovery API ID when the new asset version is updated in API Manager?

- A. The APLID does not change, so no changes to the API implementation are needed for the new asset version in the API Autodiscovery global element
- B. The API ID changes, so the API implementation must be updated with the latest API ID for the new asset version in the API Autodiscovery global element
- C. The API ID changes, but no changes are needed to the API implementation for the new asset version in the API Autodiscovery global element because the API ID is automatically updated
- D. The API ID does not change, but the API implementation must be updated in the API Autodiscovery global element to indicate the new asset version 2.0.4

Answer: A

Explanation:

Understanding API Autodiscovery in MuleSoft:

API Autodiscovery links an API implementation in Anypoint Platform with its configuration in API Manager. This is controlled by the API ID which is set in the API Autodiscovery element in the Mule application.

The API ID remains consistent across minor updates to the API asset version in Exchange (e.g., from 2.0.0 to 2.0.1) as long as it is the same API.

Effect of Asset Version Update on API Autodiscovery:

When the asset version is updated (e.g., from 2.0.0 to 2.0.1), the API ID remains the same. Therefore, no changes are needed in the Autodiscovery configuration within the Mule application. The Autodiscovery will continue to link the API implementation to the latest version in API Manager.

Evaluating the Options:

Option A: Incorrect, as the API ID does not automatically change with minor asset version updates.

Option B: Incorrect, as the API ID remains the same, so no update is needed in the API implementation.

Option C (Correct Answer): The API ID does not change, so no changes are necessary in the API implementation for the new asset version.

Option D: Incorrect, as there is no need to update the API implementation in the Autodiscovery global element for minor version changes.

Conclusion:

Option C is the correct answer, as the API ID remains unchanged with minor version updates, and no changes are needed in the API Autodiscovery configuration.

Refer to MuleSoft documentation on API Autodiscovery and version management for more details.

NEW QUESTION # 49

What is the main change to the IT operating model that MuleSoft recommends to organizations to improve innovation and clock speed?

- A. Drive consumption as much as production of assets; this enables developers to discover and reuse assets from other projects and encourages standardization
- B. Implement SOA for reusable APIs to focus on production over consumption; this standardizes on XML and WSDL formats to speed up decision making
- C. Expose assets using a Master Data Management (MDM) system; this standardizes projects and enables developers to quickly discover and reuse assets from other projects
- D. Create a lean and agile organization that makes many small decisions everyday; this speeds up decision making and enables each line of business to take ownership of its projects

Answer: A

Explanation:

Correct Answer: Drive consumption as much as production of assets; this enables developers to discover and reuse assets from other projects and encourages standardization

>> The main motto of the new IT Operating Model that MuleSoft recommends and made popular is to change the way that they are delivered from a production model to a production + consumption model, which is done through an API strategy called API-led connectivity.

>> The assets built should also be discoverable and self-serveable for reusability across LOBs and organization.

>> MuleSoft's IT operating model does not talk about SDLC model (Agile/ Lean etc) or MDM at all. So, options suggesting these are not valid.

NEW QUESTION # 50

What Anypoint Connectors support transactions?

- A. Database, 3MS, HTTP
- B. Database, JMS, VM
- C. Database, JMS, VM, SFTP
- D. Database, VM, File

Answer: B

NEW QUESTION # 51

.....

BraindumpsVCE gives a guarantee to our customers that they can pass the Salesforce Mule-Arch-201 Certification Exam on the first try by preparing from the BraindumpsVCE and if they fail to pass it despite their efforts they can claim their payment back as per terms and conditions. BraindumpsVCE facilitates customers with a 24/7 support system which means whenever they get stuck somewhere they don't struggle and contact the support system which will assist them in the right way. A lot of students have prepared from practice material and rated it positively.
