Professional Authorized 156-587 Pdf Provide Prefect Assistance in 156-587 Preparation

With the pass rate reaching 98.75%, our 156-587 test materials have gained popularity in the international market. Many candidates have recommended our products to their friends. In addition, 156-587 exam materials are edited by skilled professionals, and they possess the professional knowledge for the exam, therefore you can use the exam materials at ease. Free demo for 156-587 Exam Dumps are available, and you can have a try before buying , so that you can have a better understanding of what you are going to buy.

CheckPoint Check Point Certified Troubleshooting Expert - R81.20 Sample Questions (Q90-Q95):

NEW QUESTION # 90
The Check Point Firewall Kernel is the core component of the Gaia operating system and an integral part of traffic inspection process. There are two procedures available for debugging the firewall kernel. Which procedure/command is used for detailed troubleshooting and needs more resources?

- A. fw debug/kdebug
- B. fw ctl zdebug
- C. fw ctl debug/kdebug
- D. fw debug/kdebug ctl

Answer: C

NEW QUESTION # 91

The Check Point Watch Daemon (CPWD) monitors critical Check Point processes, terminating them or restarting them as needed to maintain consistent, stable operating conditions. When checking the status/output of CPWD you are able to see some columns like APP, PID, STAT, START, etc. What is the column "STAT" used for?

- A. Shows how many times the Watch Dog started the monitored process
- B. Shows the Watch Dog name of the monitored process
- C. Shows the status of the monitored process
- D. Shows what monitoring method Watch Dog is using to track the process

Answer: C

Explanation:
The STAT column in the output of the cpwd_admin list command shows the status of the monitored process. The possible values are E for established, meaning that the process is running, or T for terminated, meaning that the process is not running. The STAT column is useful for quickly checking if any critical process has crashed or failed to start. If the value is T, the process should be restarted and the reason for the termination should be investigated. The STAT column does not show the Watch Dog name, the number of times the process was started, or the monitoring method of the Watch Dog.

NEW QUESTION # 92

What is correct about the Resource Advisor (RAD) service on the Security Gateways?

- A. RAD is completely loaded as a kernel module that looks up URL in cache and if not found connects online for categorization There is no user space involvement in this process
- B. RAD is not a separate module, it is an integrated function of the 'fw' kernel module and does all operations in the kernel space
- C. RAD has a kernel module that looks up the kernel cache notifies client about hits and misses and forwards a-sync requests to RAD user space module which is responsible for online categorization
- D. RAD functions completely in user space The Pattern Matter (PM) module of the CMI looks up for URLs in the cache and if not found, contact the RAD process in user space to do online categorization

Answer: C

Explanation:
The Resource Advisor (RAD) service on the Security Gateways is responsible for online categorization of URLs and resources for Application Control and Threat Prevention blades. RAD has two components: a kernel module and a user space module. The kernel module looks up the kernel cache for URLs and resources, notifies the client about hits and misses, and forwards asynchronous requests to the user space module. The user space module handles the communication with the Check Point online web service and updates the kernel cache with the results. RAD can operate in three modes: hold, background, and custom, depending on the configuration of the blades and the policy. Reference:
Check Point Processes and Daemons - Section: Security Gateway Software Blades and Features - Subsection: URL Filtering Blade
Solved: Re: RAD's high utilization - Post by @PhoneBoy Check Point Certified Troubleshooting Expert (CCTE) - Exam Topics - Module 5: Advanced Access Control

NEW QUESTION # 93

What function receives the AD log event information?

- A. CPD
- B. FWD
- C. PEP
- D. ADLOG

Answer: D

Explanation:
The ADLOG function receives the AD log event information from the Domain Controllers. The ADLOG function is part of the Identity Awareness feature that enables the Security Gateway to identify users and machines in the network and enforce Access Control policy rules based on their identities. The ADLOG function uses the AD Query (ADQ) method to connect to the Active Directory Domain Controllers using WMI and subscribe to receive Security Event logs that are generated when users perform login. The ADLOG function then extracts the user and machine information that maps to an IP address from the event logs and sends it to the PEP function, which enforces the policy based on the identity information.

2: Identity Logging - Frequently Asked Questions - Check Point Software
3: Support, Support Requests, Training ... - Check Point Software

NEW QUESTION # 94
Which process is responsible for the generation of certificates?

- A. cpca
- B. cpm
- C. fwm
- D. dbsync

Answer: A

Explanation:
The cpca process is responsible for the generation of certificates on the Security Management Server or the Multi-Domain Security Management Server. It is the Check Point Internal Certificate Authority (ICA) that issues certificates for internal use, such as for VPN, HTTPS Inspection, SmartConsole, and Secure Internal Communication (SIC). The cpca process runs on the Security Management Server or the Multi-Domain Security Management Server as part of the Management High Availability module.
