CompTIA Security+ Certification Exam Sample Questions (Q323-Q328):

NEW QUESTION # 323

A systems administrator is changing the password policy within an enterprise environment and wants this update implemented on all systems as quickly as possible. Which of the following operating system security measures will the administrator most likely use?

- A. Pushing GPO update
- B. Enabling PAP
- C. Updating EDR profiles
- D. Deploying PowerShell scripts

Answer: A

Explanation:

A group policy object (GPO) is a mechanism for applying configuration settings to computers and users in an Active Directory domain. By pushing a GPO update, the systems administrator can quickly and uniformly enforce the new password policy across all

systems in the domain.

Deploying PowerShell scripts, enabling PAP, and updating EDR profiles are not the most efficient or effective ways to change the password policy within an enterprise environment.

NEW QUESTION # 324

A security administrator recently reset local passwords and the following values were recorded in the system:

Host	Account	NDS password value
ACCT-PC-1	admin	f1bdf5ed1d7a8d4e3809bd35644b0
HR-PC-1	admin	d706ab959767c131e5c57a6e28184
IT-PC-2	admin	6911843b321d7dfbf6cb05973ef0b3d
FILE-SRV-1	admin	054bbd2f5ebab9cb5571000b2c60c02
DB-SRV-1	admin	86cf9e25979e2725da78

Which of the following in the security administrator most likely protecting against?

- A. Account sharing
- B. Weak password complexity
- C. Pass-the-hash attacks
- D. Password compromise

Answer: C

NEW QUESTION # 325

A healthcare organization wants to provide a web application that allows individuals to digitally report health emergencies. Which of the following is the most important consideration during development?

- A. Ease of deployment
- B. Cost
- C. Availability
- D. Scalability

Answer: C

Explanation:

Explanation

Availability is the ability of a system or service to be accessible and usable when needed. For a web application that allows individuals to digitally report health emergencies, availability is the most important consideration during development, because any downtime or delay could have serious consequences for the health and safety of the users. The web application should be designed to handle high traffic, prevent denial-of-service attacks, and have backup and recovery plans in case of failures.

NEW QUESTION # 326

A company wants to reduce the time and expense associated with code deployment. Which of the following technologies should the company utilize?

- A. Thin clients
- B. Private cloud
- C. Virtual machines
- D. Serverless architecture

Answer: D

Explanation:

Serverless architecture allows companies to deploy code without managing the underlying infrastructure. This approach significantly reduces the time and expense involved in code deployment because developers can focus solely on writing code, while the cloud provider manages the servers, scaling, and maintenance. Serverless computing also enables automatic scaling and pay-per-execution billing, which further optimizes costs.

highlighted as a method to streamline and reduce costs associated with code deployment.

NEW QUESTION # 327

An office wants to install a Wi-Fi network. The security team must ensure a secure design. The access points will be more powerful and use WPA3 with a 16-character randomized key. Which of the following should the security team do next?

- A. Enable WPA2-PSK with a 24-character randomized key.
- **B. Create a heat map of the building perimeter.**
- C. Disable SSH administration on all access points.
- D. Deploy IPsec tunnels from each access point to the controller.

Answer: B

Explanation:

Because the organization plans to deploy high-powered wireless access points, the next critical step is to create a heat map of the building perimeter. CompTIA Security+ SY0-701 highlights wireless heat maps as an essential design tool for identifying signal bleed, coverage overlap, dead zones, and areas where wireless signals extend beyond intended boundaries.

Stronger access points increase the risk of signal leakage outside the building, which could allow unauthorized users to attempt connections from parking lots or nearby buildings. A heat map enables the security team to visualize RF propagation and adjust power levels, antenna placement, and access point locations to minimize external exposure while maintaining internal coverage.

Deploying IPsec tunnels (B) is unnecessary for standard WLAN architectures. Enabling WPA2-PSK (C) weakens security compared to WPA3. Disabling SSH administration (D) is a hardening step but does not address wireless coverage risks.

Therefore, the correct next step in secure Wi-Fi design is A: Create a heat map of the building perimeter.
