NEW QUESTION # 100

Refer to the exhibit.

□ Which command was used to generate this output and to show which ports are authenticating with dot1x or mab?

- A. show authentication method
- B. show dot1x all
- C. **show authentication sessions**
- D. show authentication registrations

Answer: C

NEW QUESTION # 101

What are two workload security models? (Choose two.)

- A. off-premises
- B. SaaS
- C. **on-premises**
- D. PaaS
- E. IaaS

Answer: A,C

Explanation:

Workload security models refer to the ways of protecting applications, services, and capabilities that run on a cloud resource. There are different types of cloud deployment models, such as public, private, hybrid, and multicloud, and different types of cloud service models, such as IaaS, PaaS, and SaaS. However, these are not workload security models, but rather ways of describing the cloud environment and the level of abstraction.

Workload security models are more focused on the location and ownership of the workloads, and how they are secured. The two main workload security models are off-premises and on-premises. Off-premises workload security model means that the workloads are hosted and managed by a third-party cloud service provider, such as AWS, Azure, or GCP. The cloud service provider is responsible for the security of the underlying infrastructure, such as the physical servers, network devices, storage systems, and hypervisors.

The customer is responsible for the security of the workloads themselves, such as the guest operating systems, applications, data, and users. The customer can use various tools and techniques to secure their workloads, such as encryption, firewalls, identity and access management, vulnerability scanning, and logging and monitoring. On-premises workload security model means that the workloads are hosted and managed by the customer on their own data center or private cloud. The customer is responsible for the security of both the infrastructure and the workloads, and has full control and visibility over them. The customer can use similar tools and techniques as the off-premises model, but also has to deal with the physical security, network security, and compliance requirements of their own environment. NEW QUESTION # 102

Drag and drop the common security threats from the left onto the definitions on the right.

Answer:

Explanation:

NEW QUESTION # 103

Which method is used to deploy certificates and configure the supplicant on mobile devices to gain access to network resources?

- A. Client provisioning
- B. Simple Certificate Enrollment Protocol
- **C. BYOD on boarding**
- D. MAC authentication bypass

Answer: C

Explanation:

When supporting personal devices on a corporate network, you must protect network services and enterprise data by authenticating and authorizing users (employees, contractors, and guests) and their devices. Cisco ISE provides the tools you need to allow employees to securely use personal devices on a corporate network. Guests can add their personal devices to the network by running the native supplicant provisioning (Network Setup Assistant), or by adding their devices to the My Devices portal. Because native supplicant profiles are not available for all devices, users can use the My Devices portal to add these devices manually; or you can configure Bring Your Own Device (BYOD) rules to register these devices. Reference:
