

Free PDF 2026 VMware Marvelous Customizable 3V0-23.25 Exam Mode

We are dedicated to providing our clients with the most current and accurate Advanced VMware Cloud Foundation 9.0 Storage study material. That is why we provide 1 year of free 3V0-23.25 questions updates if the VMware certification test content changes after your purchase. With this option, our clients can confidently use the most up-to-date and dependable 3V0-23.25 preparatory material.

It is a common sense that in terms of a kind of Advanced VMware Cloud Foundation 9.0 Storage test torrent, the pass rate would be the best advertisement, since only the pass rate can be the most powerful evidence to show whether the 3V0-23.25 guide torrent is effective and useful or not. We are so proud to tell you that according to the statistics from the feedback of all of our customers, the pass rate among our customers who prepared for the exam under the guidance of our Advanced VMware Cloud Foundation 9.0 Storage test torrent has reached as high as 98% to 100%, which definitely marks the highest pass rate in the field. Therefore, the 3V0-23.25 Guide Torrent compiled by our company is definitely will be the most sensible choice for you.

VMware 3V0-23.25 Valid Study Guide - 3V0-23.25 Prep Guide

Candidates who become VMware 3V0-23.25 certified demonstrate their worth in the VMware field. 3V0-23.25 certification is proof of their competence and skills. This is a highly sought after credential and it makes career advancement easier for the candidate. To become VMware 3V0-23.25 Certified, you must pass the Advanced VMware Cloud Foundation 9.0 Storage (3V0-23.25) Exam. For this task, you need actual and updated 3V0-23.25 Questions.

VMware Advanced VMware Cloud Foundation 9.0 Storage Sample Questions (Q136-Q141):

NEW QUESTION # 136

An Infrastructure Manager is utilizing the vSphere Lifecycle Manager (vLCM) in SDDC Manager to perform a firmware upgrade on the physical NVMe drives in a vSAN ESA cluster.

...

```
# vLCM Desired State Specification (JSON)
```

```
{  
  "esx_version": "8.0U2",  
  "vendor_addon": "DellEMC-OpenManage-v10",  
  "firmware_baseline": "Dell-NVMe-Gen4-v5.3.1"  
}
```

...

How does vLCM natively handle the disruption of upgrading live NVMe firmware inside a running vSAN Express Storage Architecture cluster?

- A. vLCM orchestrates the process by sequentially putting one host at a time into Maintenance Mode (using Ensure

Accessibility), applying the new firmware payload via the Hardware Support Manager (HSM), and rebooting the host to initialize the NVMe controllers.

- B. NVMe firmware upgrades are strictly "Hot-Add" and do not require ESXi host reboots or Maintenance Mode, allowing the drives to flash in the background without user intervention.
- C. The firmware is upgraded directly from the physical Top-of-Rack network switches via Redfish protocol, bypassing the ESXi hypervisor entirely.
- D. vLCM automatically copies all virtual machines to the remote vSphere Replication site before initiating the firmware flash to protect the data layer.

Answer: A

NEW QUESTION # 137

A Compliance Auditor is reviewing the storage state of a Tanzu environment hosted on VCF. The auditor notices a critical "Orphaned CNS Volumes" warning in the Skyline Health dashboard.

...

[Skyline Health > Cloud Native Storage]

CNS Volume Health

Volume ID: 52a1... (pvc-finance-db)

SPBM Compliance: N/A

Issue: Shadow / Orphaned Volume

...

Upon investigation, a junior administrator admits they used the vCenter GUI to delete the underlying First Class Disk (FCD) VMDK to free up space, because the Kubernetes Pod using it was temporarily powered off.

Which TWO statements accurately describe the resulting architectural anti-pattern and its consequence?

(Choose 2.)

- A. The junior admin successfully reclaimed the space; Kubernetes will automatically regenerate the data from the container image when the pod restarts.
- B. CNS will automatically detect the missing FCD and trigger a vSAN DOM re-sync to reconstruct the deleted disk from the Witness metadata.
- C. Deleting the FCD via vCenter breaks the Control Plane integration; Kubernetes still believes the Persistent Volume (PV) exists, leaving the cluster in a "Shadow" out-of-sync state.
- D. First Class Disks (FCDs) are ephemeral by definition and should be deleted manually whenever a pod shuts down to maintain cluster efficiency.
- E. The Kubernetes pod will fail to start and enter a "CrashLoopBackOff" state because the CSI driver cannot mount the physical backing disk that was deleted.

Answer: C,E

NEW QUESTION # 138

An Operations Engineer is managing a VCF Stretched Cluster configured with "Dual Site Mirroring" across Site A and Site B, plus a Witness.

A severe network failure causes "Total Site Isolation" at Site A. Site A completely loses network connectivity to BOTH Site B (the ISL drops) AND the remote Witness Appliance. Site A retains power and local networking.

...

vSAN Unicast Agent Status (Post-Failure Snapshot)

Site A Hosts -> Can only ping Site A Hosts.

Site B Hosts -> Can ping Site B Hosts AND Witness.

...

How do the Unicast Partition Groups and vSphere HA mechanics interact to resolve this specific Disaster Recovery scenario?

(Select all that apply.)

- A. The vCenter Server automatically forces the Witness Appliance to migrate to Site A to re-establish quorum.
- B. Site B and the Witness form the majority Partition Group (66% of votes). The DOM verifies quorum and makes the Site B data active.
- C. Site A forms its own local Partition Group, but because it holds less than 50% of the votes (no Site B, no Witness), DOM strips quorum, locking all storage access for the VMs on Site A.
- D. Virtual machines on Site A will continue to run normally using their local SSD cache to absorb writes indefinitely until the

network is restored.

- E. vSphere HA detects that Site A's VMs have lost their datastore and network, triggering a cold restart of all Site A Virtual Machines onto the surviving compute hosts at Site B.

Answer: B,C,E

NEW QUESTION # 139

A Compliance Auditor is observing the physical decommissioning of a failed NVMe drive from a highly secure VCF financial cluster. The vSAN cluster is configured with Data-at-Rest Encryption (D@RE) tied to an external KMS.

...

[Log Analysis: vpxd.log - Disk Removal Event]

2026-11-20T14:00:00Z INFO vpxd - [vSAN] Disk naa.500B... evacuated successfully.

2026-11-20T14:00:02Z INFO vpxd - [vSAN] Unmounting disk naa.500B...

2026-11-20T14:00:05Z INFO vpxd - [KMS] Key ID: 55a3... securely erased from host memory.

...

How does the interaction between the physical disk removal and the vSAN Encryption architecture satisfy strict data compliance wiping standards (e.g., NIST Crypto-Erase)? (Select all that apply.)

- A. The ESXi host must execute a standard 3-pass overwrite algorithm directly on the drive using vSAN LSOM commands before releasing the drive latch.
- B. When the disk is unmounted from the vSAN pool, the ESXi hypervisor immediately deletes the unique Disk Encryption Key (DEK) associated with that specific drive from its secure volatile memory.
- C. Without the DEK, the residual data physically remaining on the NVMe flash cells is mathematically unrecoverable, completing a near-instantaneous "Crypto-Erase".
- D. The external KMS server issues a command to detonate the physical TPM chip on the NVMe drive to prevent data recovery.
- E. The administrator must connect the drive to a standalone Linux server to execute a dd command (zero-wipe) before it can be handed to the hardware recycler.

Answer: B,C

NEW QUESTION # 140

Which statement accurately defines the primary architectural function of the Cluster Level Object Manager (CLOM) within the VMware vSAN storage stack?

- A. CLOM intercepts guest VM I/O at the hypervisor level and routes the SCSI commands over the vSAN network to the appropriate Distributed Object Manager (DOM) instances.
- B. CLOM executes the final log-structured write operations, deduplication, and compression directly onto the physical NVMe storage pool devices.
- C. CLOM is responsible for evaluating SPBM requirements, generating the initial component distribution tree across the cluster, and orchestrating self-healing rebuilds when host failures occur.
- D. CLOM is a Kubernetes control plane component that maps Container Storage Interface (CSI) requests into physical vSAN First Class Disks (FCDs).

Answer: C
