dbt Labs dbt Analytics Engineering Certification Exam Sample Questions (Q237-Q242):

NEW QUESTION # 237

Which two are true about version controlling code with Git?

Choose 2 options.

- A. Code can be reverted to a previous state.
- B. When bugs are raised, email notifications are automatically sent by Git to repository users.
- C. Git prevents any sensitive fields from being saved in code.
- D. Git automatically creates versions of files with suffixes.
- E. All the code changes along the lifecycle of a project are tracked.

Answer: A,E

Explanation:

The correct answers are B: All the code changes along the lifecycle of a project are tracked, and E: Code can be reverted to a previous state.

Git is a distributed version control system designed to maintain a complete, chronological history of all code changes. Every commit records who made the change, when it occurred, and what the modification included.

This ensures transparency, reproducibility, and accountability across the development lifecycle, which makes B correct. Git also allows users to revert code to any previous commit, branch, or tag, making E correct as well. This capability is critical for recovering from mistakes, undoing faulty deployments, and ensuring stable releases.

Option A is incorrect because Git does not create file versions with suffixes; instead, it stores changes as snapshots within a repository. File suffixing is not part of Git's functionality.

Option C is incorrect because Git does not automatically send email notifications. Notification mechanisms come from hosting platforms like GitHub, GitLab, or Bitbucket-not from Git itself.

Option D is incorrect because Git does not prevent committing sensitive information. Developers must manually ensure secrets are excluded via .gitignore, secret managers, or pre-commit hooks. Git will store whatever is committed unless prevented through tooling.

Thus, only B and E correctly describe how Git supports version control in analytics engineering and dbt workflows.

NEW QUESTION # 238

You've configured your project to include both schema and data tests in the generated documentation. A user reports the tests are visible but don't show any execution results (pass/fail status). Why might this be happening?

- A. The type of test you're using is not supported for displaying results in the documentation.
- B. Your data pipeline hasn't been executed recently, so there are no recent test results.
- C. The documentation generator has a known limitation on how test results are displayed.
- D. The project settings are explicitly configured to hide test results in the documentation.

Answer: B,D

Explanation:

A Test results depend on recent executions; if your data pipeline is not updated, there won't be fresh results. B: Its possible to have configurations that display the tests themselves but not their execution results

NEW QUESTION # 239

Your data warehouse environment undergoes a major version upgrade, introducing changes in SQL syntax and supported functions. How would you handle the migration of dbt projects to ensure compatibility?

- A. All of the above.
- B. Utilize custom macros to introduce conditional logic or abstract away syntax differences between versions, if feasible.
- C. Thoroughly test all dbt models across your staging and development environments to identify necessary updates.
- D. Create temporary branches in your dbt projects to isolate upgrade-related code changes for each environment

Answer: A

Explanation:

A: Branches facilitate staged testing and rollback, if necessary. B: Testing in lower environments uncovers potential issues before production deployment. C Macros can in some cases smooth over compatibility issues.

NEW QUESTION # 240

A model depends heavily on geospatial calculations, which are computationally expensive. What optimization strategy might be worth exploring?

- A. Convert the model to a snapshot to leverage historical data more effectively.
- B. Ensure the underlying data adheres to DRY principles.
- **C. Investigate whether the database offers specialized geospatial indexes or functions.**
- D. Pre-calculate common geospatial results as an incremental model.

Answer: C

Explanation:

Optimized database functionality is crucial for complex calculations. While option A could be beneficial, it's important to first utilize database-level optimizations.

NEW QUESTION # 241

You're building tests for a dbt model that performs a join across multiple large datasets. You notice performance issues - tests are taking a very long time to run. What might be optimization strategies?

- **A. Refactor model SQL to use incremental logic to avoid full table scans.**
- B. Accept that tests on complex models will always be slow.
- **C. Focus on tests that can validate a subset of the data rather than the entire dataset.**
- D. Create snapshots of the source tables and test on those snapshots instead.

Answer: A,C

Explanation:

B and C target reducing the test's workload with sampling or optimizing the model itself. A might help under specific circumstances, but not always. D is a defeatist approach!
