Mule-Dev-202 Prepaway Dumps | Mule-Dev-202 Test Guide Online

Our Mule-Dev-202 exam questions are high quality and efficiency test tools. The knowledge in our Salesforce Certified MuleSoft Hyperautomation Developer torrent prep is very comprehensive because our experts in various fields will also update dates in time to ensure quality, you can get latest materials within one year after you purchase. What's more, you can learn our Mule-Dev-202 Test Guide whether you are at home or outside. Based on the concept of service and in order to help every study succeed, we have a good reputation and security system to protect our customer's information.

Salesforce Certified MuleSoft Hyperautomation Developer Sample Questions

(Q33-Q38):

NEW QUESTION # 33

Which component of Anypoint Platform is responsible for enforcing API policies?

- A. API Analytics
- **B. API Gateway**
- C. API Manager
- D. API Runtime

Answer: B

Explanation:

The component of Anypoint Platform responsible for enforcing API policies is the API Gateway:

API Gateway:

The API Gateway is a runtime component that enforces policies applied to APIs. It acts as an intermediary that manages API traffic, security, and performance by applying the policies configured in API Manager.

Policies such as rate limiting, security, transformation, and monitoring are enforced at the API Gateway to ensure that APIs are accessed securely and efficiently.

NEW QUESTION # 34

AnyAirlines is attempting to automate a process that triggers when a case is created in Salesforce but requires data to be extracted from a website without an API. It plans to automate the process using MuleSoft Composer and MuleSoft RPA.

During the design phase, it uses RPA Recorder to gather the steps required to interact with the website.

What will automatically be gathered by RPA Recorder when recording a manual activity?

- **A. Documentation on the elements used by the user during the process**
- B. Conditional decisions made by the user during the process
- C. Variable information used by the user during the process
- D. Comments on the purpose of the different steps carried out by the user

Answer: A

Explanation:

When using MuleSoft RPA Recorder to gather steps required for interacting with a website, it automatically collects documentation on the elements used by the user during the process.

MuleSoft RPA Recorder:

Automatic Element Documentation: The RPA Recorder captures all the elements (e.g., buttons, fields, and other UI components) that the user interacts with during the manual process recording.

Metadata Collection: It collects metadata such as element IDs, types, and positions, which are essential for accurately replicating the manual actions during automation.

Why Not Other Options:

Variable Information: While variable information is important, it is not the primary focus of the RPA Recorder. Variables can be defined post-recording.

Conditional Decisions: Conditional logic is typically added during the design phase of the RPA script, not during the initial recording.

Comments: User comments on the purpose of steps are not automatically recorded; this information needs to be added manually.

For more detailed information on how MuleSoft RPA Recorder works, refer to MuleSoft's official RPA documentation

NEW QUESTION # 35

What is the difference between Run and Debug modes in Flow Builder?

- A. Debug mode uses AI to fix any bugs in the flow.
- **B. Debug mode displays details for debugging the flow.**
- C. Run mode is only available for active flows.
- D. Run mode uses the latest version of the flow.

Answer: B

Explanation:

In Flow Builder, Run and Debug modes have distinct functionalities:

Run Mode:

Executes the flow as it is, allowing you to see the end-to-end execution based on the latest saved version.

Typically used to verify that the flow works as expected under normal conditions.

Debug Mode:

Provides detailed information for each step of the flow, including input and output data, and any errors encountered.

Useful for troubleshooting and identifying issues within the flow, allowing developers to understand how the flow executes and where problems may arise.

Debug mode is specifically designed to aid in diagnosing and fixing issues by providing a granular view of the flow's execution.

Salesforce Flow Builder Documentation

NEW QUESTION # 36

AnyAirlines has a MuleSoft Composer flow between NetSuite and Salesforce. One of the data elements coming from NetSuite is a string that needs to be put into a Boolean field in a Salesforce object.

Which Composer function should be used to change the datatype of the value?

- A. fromBooleanToString()
- **B. fromStringToBoolean()**
- C. today()
- D. substitute()

Answer: B

Explanation:

To convert a string from NetSuite into a Boolean field in a Salesforce object within MuleSoft Composer, you should use the `fromStringToBoolean()` function:

Function Purpose:

The `fromStringToBoolean()` function is specifically designed to convert string values to Boolean values. It interprets common Boolean strings like "true", "false", "yes", "no" and converts them into their corresponding Boolean values.

Usage:

Within MuleSoft Composer, use this function in a transformation step to ensure the data coming from NetSuite (as a string) is correctly transformed into a Boolean value before it is mapped to the Salesforce object.

Example:

If the string value from NetSuite is "true", `fromStringToBoolean("true")` will convert this to true in the Boolean field in Salesforce.

MuleSoft Composer Functions Documentation

NEW QUESTION # 37

An employee at AnyAirlines uses RPA Recorder to capture actions performed when carrying out a business process automation.

How does this help expedite RPA process development?

- A. BPMN is autogenerated, including documentation in the form of images and a fully functional RPA process with workflows and conditional branching.
- **B. BPMN is autogenerated, which includes documentation in the form of images and a complete recording of keyboard actions and wait times.**
- C. BPMN is autogenerated with documentation and workflows containing the recorded actions that are automatically created during the build phase.
- D. BPMN is autogenerated with complete test plans and run configurations that can be executed in the test and production phases.

Answer: B

Explanation:

Using RPA Recorder to capture actions performed during a business process automation helps expedite RPA process development in the following way:

Autogenerating BPMN:

The RPA Recorder captures the business process as it is performed and autogenerates a Business Process Model and Notation (BPMN) diagram. This diagram includes a visual representation of the process, making it easier to understand and modify.

Detailed Documentation:

Along with the BPMN, the recorder generates detailed documentation that includes images of the steps performed, as well as a complete recording of keyboard actions and wait times. This provides a comprehensive view of the process, which can be reviewed and refined.

Expediting Development:

By automating the creation of BPMN and detailed documentation, the RPA Recorder significantly reduces the time required to document and design the RPA process manually. This allows developers to focus on refining and optimizing the process rather than starting from scratch.
