HPE Edge-to-Cloud Solutions Sample Questions (Q78-Q83):

NEW QUESTION # 78

Your customer needs assistance updating their database infrastructure with a modern solution that will grow with their needs and free up their IT staff to focus on value added activities.

Which of the following benefits would the customer receive by choosing HPE GreenLake for database?

- A. Offload monitoring and modifying databases with HPE GreenLake management services.
- B. Order prioritization with delivery and provisioning of new capacity in 7 days or fewer.
- C. Time savings with a fully managed VDI solution hosted in their choice of AWS or Azure.
- D. Cost savings with a community cloud operating model that supports sharing resources with other tenants.

Answer: A

Explanation:

The customer would receive the benefit of offloading monitoring and modifying databases with HPE GreenLake management services by choosing HPE GreenLake for database. This is because HPE GreenLake for database is a cloud service that delivers optimized infrastructure and management services for business-critical databases such as SQL Server, Oracle, and EDB Postgres. HPE GreenLake for database offers the following benefits for the customer:

It provides a pay-per-use pricing model that aligns costs with usage and avoids overprovisioning or underutilization of resources¹². It enables a self-service portal that allows the customer to provision, scale, and manage databases on demand, with point-and-click simplicity¹³.

It leverages HPE InfoSight, an AI-powered platform that provides predictive analytics, proactive recommendations, and automated actions to prevent issues, optimize performance, and reduce costs for database environments¹⁴.

It includes HPE GreenLake management services, which provide 24x7 monitoring, backup, patching, and tuning of databases, freeing up the customer's IT staff to focus on value-added activities¹⁵.

The other options are not benefits of HPE GreenLake for database because:

A). Cost savings with a community cloud operating model that supports sharing resources with other tenants. HPE GreenLake for database does not use a community cloud operating model, which is a cloud service that is shared among multiple organizations with common interests or goals. HPE GreenLake for database uses a private cloud operating model, which is a cloud service that is dedicated to a single organization and hosted on-premises or in a colocation facility⁶⁷.

B). Time savings with a fully managed VDI solution hosted in their choice of AWS or Azure. HPE GreenLake for database does not provide a VDI solution, which is a virtual desktop infrastructure that delivers desktops and applications to end users from a centralized server. HPE GreenLake for database provides a database solution, which is a data management system that stores, organizes, and manipulates data for various applications. HPE GreenLake for database also does not host the solution in AWS or Azure, which are public cloud providers. HPE GreenLake for database hosts the solution on-premises or in a colocation facility⁸⁹.

C). Order prioritization with delivery and provisioning of new capacity in 7 days or fewer. HPE GreenLake for database does not guarantee delivery and provisioning of new capacity in 7 days or fewer. HPE GreenLake for database provides a buffer capacity that is reserved for the customer and can be activated instantly when needed. However, if the customer requires additional capacity beyond the buffer, the delivery and provisioning time may vary depending on the availability and complexity of the solution .

NEW QUESTION # 79

Your customer would like to adopt a pay-per-use consumption model with GreenLake for Private Cloud Enterprise. Which important factor should you share with them?

- A. PCE bare metal servers are not included in pay-per-use billing.
- B. They can select any pay-per-use unit of measure they prefer.
- C. PCE is pay-per-use but must be serviced by an HPE Partner.
- **D. The pay-per-use billing includes a minimum reserve.**

Answer: D

Explanation:

HPE GreenLake for Private Cloud Enterprise is a fully managed cloud service that delivers a public cloud-like experience for bare metal, containers, and VMs in your private environment. It is a true pay-per-use solution that allows you to pay for what you use, subject to a minimum monthly reservation fee. The minimum reserve is based on the expected usage of the infrastructure and can be adjusted as needed. The minimum reserve ensures that you have enough capacity to meet your performance and availability requirements, while also benefiting from the flexibility and scalability of the pay-per-use model. You can monitor your usage and billing through the HPE GreenLake Central portal, which provides consumption analytics and insights. NEW QUESTION # 80

What is the appropriate use case for a hybrid solution?

- **A. When scalability and flexibility are critical requirements**
- B. When data needs to be stored on-premises
- C. When there is a need for low-speed network connectivity
- D. When legacy systems are no longer in use

Answer: A

NEW QUESTION # 81

What is the correct method to calculate incremental cash flow?

- **A. Subtract projected increase in revenue or decrease in costs from the initial investment.**
- B. Multiply the increase in revenue by the time needed to offset the IT investment.
- C. Subtract projected decrease in revenue or increase in costs from the initial investment.
- D. Divide the increase in revenue by the time needed to offset the IT investment.

Answer: A

Explanation:

Incremental cash flow is the difference between the cash flow of a project with the investment and the cash flow of the same project without the investment. It represents the net change in cash flow that results from making the investment. The correct method to calculate incremental cash flow is to subtract projected increase in revenue or decrease in costs from the initial investment. This method captures the additional cash inflows and outflows that are attributable to the investment, and excludes any cash flows that are unrelated to the investment. Incremental cash flow can help you evaluate the profitability and feasibility of an IT investment by comparing it to the required rate of return or the payback period.
