The AWS-Solutions-Associate Certification is an essential credential for cloud computing professionals who want to demonstrate their knowledge and expertise in designing and deploying cloud architectures on AWS. AWS Certified Solutions Architect - Associate (SAA-C03) certification is recognized by industry leaders and is a valuable asset for individuals who are looking to advance their careers in cloud computing. AWS Certified Solutions Architect - Associate (SAA-C03) certification also helps

organizations to identify and hire skilled cloud professionals who can design and deploy scalable, fault-tolerant systems on AWS.

Amazon AWS Certified Solutions Architect - Associate (SAA-C03) Sample Questions (Q70-Q75):

NEW QUESTION # 70
A solutions architect is designing a solution that requires frequent updates to a website that is hosted on Amazon S3 with versioning enabled. For compliance reasons, the older versions of the objects will not be accessed frequently and will need to be deleted after 2 years.
What should the solutions architect recommend to meet these requirements at the LOWEST cost?

- A. Enable S3 Event Notifications on the bucket that sends older objects to the Amazon Simple Queue Service (Amazon SQS) queue for further processing.
- B. Use S3 batch operations to replace object tags. Expire the objects based on the modified tags.
- C. Replicate older object versions to a new bucket. Use an S3 Lifecycle policy to expire the objects in the new bucket after 2 years.
- D. Configure an S3 Lifecycle policy to transition older versions of objects to S3 Glacier. Expire the objects after 2 years.

Answer: D

NEW QUESTION # 71
A Solutions Architect must review an application deployed on EC2 instances that currently stores multiple 5-GB files on attached instance store volumes. The company recently experienced a significant data loss after stopping and starting their instances and wants to prevent the data loss from happening again. The solution should minimize performance impact and the number of code changes required.
What should the Solutions Architect recommend?

- A. Store the application data in Amazon DynamoDB
- B. Store the application data in an EBS volume
- C. Store the application data in Amazon ElastiCache
- D. Store the application data in Amazon S3

Answer: B

NEW QUESTION # 72
An organization is setting up a backup and restore system in AWS of their in premise system. The organization needs High Availability(HA) and Disaster Recovery(DR) but is okay to have a longer recovery time to save costs.
Which of the below mentioned setup options helps achieve the objective of cost saving as well as DR in the most effective way?

- A. Setup the backup data on S3 and transfer data to S3 regularly using the storage gateway.
- B. Replicate on premise DB to EC2 at regular intervals and setup a scenario similar to the pilot light.
- C. Setup a small instance with AutoScaling; in case of DR start diverting all the load to AWS from on premise.
- D. Setup pre-configured servers and create AMIs. Use EIP and Route 53 to quickly switch over to AWS from in premise.

Answer: A

Explanation:
AWS has many solutions for Disaster Recovery(DR) and High Availability(HA). When the organization wants to have HA and DR but are okay to have a longer recovery time they should select the option backup and restore with S3. The data can be sent to S3 using either Direct Connect, Storage Gateway or over the internet.
The EC2 instance will pick the data from the S3 bucket when started and setup the environment. This process takes longer but is very cost effective due to the low pricing of S3. In all the other options, the EC2 instance might be running or there will be AMI storage costs. Thus, it will be a costlier option. In this scenario the organization should plan appropriate tools to take a backup, plan the retention policy for data and setup security of the data.

NEW QUESTION # 73
When creation of an EBS snapshot is initiated, but not completed, the EBS volume:

- A. Can be used while the snapshot is in progress.
- B. Cannot be used until the snapshot completes.
- C. Cannot be detached or attached to an EC2 instance until the snapshot completes
- D. Can be used in read-only mode while the snapshot is in progress.

Answer: A

NEW QUESTION # 74
A company is preparing to store confidential data in Amazon S3. For compliance reasons, the data must be encrypted at rest. Encryption key usage must be logged for auditing purposes. Keys must be rotated every year.
Which solution meets these requirements and is the MOST operationally efficient?

- A. Server-side encryption with AWS KMS (SSE-KMS) customer master keys (CMKs) with manual rotation
- B. Server-side encryption with AWS KMS (SSE-KMS) customer master keys (CMKs) with automatic rotation
- C. Server-side encryption with Amazon S3 managed keys (SSE-S3)
- D. Server-side encryption with customer-provided keys (SSE-C)

Answer: B
