## NSE7\_SSE\_AD-25 Valid Study Questions, NSE7\_SSE\_AD-25 100% Correct Answers

You must make a decision as soon as possible! I don't know where you heard about NSE7\_SSE\_AD-25 actual exam, but you must know that there are many users of our NSE7\_SSE\_AD-25 study materials. Some of these users have already purchased a lot of information. They completed their goals with our NSE7\_SSE\_AD-25 learning braindumps. Now they have a better life. As you know the company will prefer to employ the staffs with the NSE7\_SSE\_AD-25 certification.

## Fortinet NSE 7 - FortiSASE 25 Enterprise Administrator Sample Questions (Q74-Q79):

### NEW QUESTION # 74

Which secure internet access (SIA) use case minimizes individual endpoint configuration?

- A. Site-based remote user internet access
- B. Agentless remote user internet access
- C. SIA using ZTNA
- D. SIA for FortiClient agent remote users

**Answer: A**

Explanation:

Site-based remote user internet access minimizes individual endpoint configuration by routing user traffic through a centralized FortiSASE connection point (such as a FortiAP or FortiGate), rather than requiring each device to be individually configured with the FortiClient agent.

### NEW QUESTION # 75

What is the purpose of security posture tagging in ZTNA? (Choose one answer)

- A. To categorize devices and users based on their role in the organization
- B. To assign usernames to different devices for security logs
- C. To provide granular access control based on the compliance status of devices and users<sup>1</sup>
- D. To ensure that all devices and users are monitored continuously

**Answer: C**

Explanation:

In the context of Zero Trust Network Access (ZTNA), security posture tagging is the fundamental mechanism used to enforce compliance and security standards before granting access to protected resources.

\* Granular Access Control: The primary purpose of tagging is to provide granular access control.<sup>3</sup> Instead of relying solely on static credentials, ZTNA uses these dynamic tags to determine if a device or user meets specific security requirements at the moment of the connection request.

\* Compliance-Based Enforcement: Tags are assigned based on the compliance status of the endpoint.

For example, the FortiSASE Endpoint Management Service (EMS) can verify if a device has an active antivirus, is running a specific OS version, or is joined to the corporate domain.<sup>5</sup> If the device fails any of these checks, the "Compliant" tag is removed, and access is automatically revoked.

\* Dynamic and Continuous Assessment: Unlike traditional VPNs that check posture only at login, ZTNA posture tagging allows for continuous assessment. If a device's security posture changes—for instance, if the user disables their firewall—the tag is updated in real-

time across the Security Fabric, and the ZTNA policy will immediately deny further access.<sup>8</sup>

\* Integration with Policies: On the FortiGate (acting as a ZTNA proxy) or within FortiSASE, these tags are used as source criteria in ZTNA policies.<sup>9</sup> Only traffic originating from endpoints with the required tags (e.g., "EMS-Tag: Corporate-Managed") is permitted to reach the protected application.

#### NEW QUESTION # 76

What happens to the logs on FortiSASE that are older than the configured log retention period? (Choose one answer)

- **A. The logs are deleted from FortiSASE.<sup>1</sup>**
- B. The logs are backed up on FortiCloud.
- C. The logs are indexed and can be stored in a SQL database.
- D. The logs are compressed and archived.

**Answer: A**

Explanation:

In a FortiSASE environment, log management is governed by a cloud-native storage policy that prioritizes performance and resource availability.

\* Retention Policy Framework: All FortiSASE instances come with log retention enabled by default.

The standard log retention period is 30 days, though administrators can customize this policy to any duration between 2 and 30 days. This policy applies across all log types, including traffic, security, and event logs.

\* Automatic Deletion (A): When logs exceed the configured retention threshold, FortiSASE automatically deletes the older logs from the platform.<sup>2</sup> This automatic purging is necessary to free up storage space on the cloud infrastructure and maintain compliance with the organization's data lifecycle settings.

\* Persistence and Recovery: Once logs are deleted due to the expiration of the retention period, they are generally unrecoverable from the FortiSASE platform.

\* Long-Term Storage Solutions: Because FortiSASE is not designed as a long-term archival solution, customers who need to store logs for months or years for regulatory compliance should configure log forwarding to an external server, such as a FortiAnalyzer or a remote Syslog server.

\* Analysis of Incorrect Options: \* Option B and D: While traditional FortiAnalyzer deployments use SQL indexing and separate "Archive" (raw/compressed) vs. "Analytics" (SQL) tiers, FortiSASE uses a simplified cloud storage model where data is purged rather than archived or tier-shifted upon expiry.

\* Option C: While FortiSASE is part of the FortiCloud ecosystem, it does not automatically "back up" expired logs to another FortiCloud service; the deletion is final unless external forwarding is active.

#### NEW QUESTION # 77

Which statement best describes the Digital Experience Monitor (DEM) feature on FortiSASE?

- **A. It provides end-to-end network visibility from all the FortiSASE security PoPs to a specific SaaS application.**
- B. It gathers all the vulnerability information from all the FortiClient endpoints.
- C. It is used for performing device compliance checks on endpoints.
- D. It monitors the FortiSASE POP health based on ping probes.

**Answer: A**

Explanation:

The Digital Experience Monitor (DEM) in FortiSASE measures and monitors network performance from the FortiSASE Points of Presence (PoPs) to specific SaaS or cloud applications, helping identify and troubleshoot performance issues across the service path.

#### NEW QUESTION # 78

In the Secure Private Access (SPA) use case, which two FortiSASE features facilitate access to corporate applications? (Choose two answers)

- **A. zero trust network access (ZTNA)**
- **B. SD-WAN**
- C. thin edge

- D. cloud access security broker (CASB)

**Answer: A,B**

Explanation:

In a FortiSASE deployment, the Secure Private Access (SPA) use case is specifically designed to provide remote users with secure, high-performance connectivity to internal corporate applications hosted in private data centers or public clouds.<sup>5</sup> This is achieved through two primary architectural methods:

\* SD-WAN Integration (A): FortiSASE integrates natively with existing Fortinet Secure SD-WAN networks.<sup>6</sup> In this architecture, the FortiSASE global PoPs act as spokes that establish automated IPsec tunnels to the organization's FortiGate SD-WAN hubs. This allows the platform to use intelligent application steering and dynamic routing to find the shortest, most efficient path to private resources, ensuring a superior user experience.

\* Zero Trust Network Access (ZTNA) (B): FortiSASE provides Universal ZTNA to enforce granular, per-session access control.<sup>7</sup> Unlike traditional VPNs that grant broad network access, ZTNA verifies the user's identity and the endpoint's security posture (via ZTNA tags) before every application session.

This ensures that users only have access to the specific corporate applications they are authorized to use, significantly reducing the attack surface.

\* Analysis of Other Options: \* Thin Edge (C) is a connectivity method used to secure branch offices and micro-branches (typically using FortiExtender), rather than a specific feature for facilitating private corporate application access for individual remote users.

\* CASB (D) is used for Secure SaaS Access (SSA) to provide visibility and control over third-party cloud applications like Office 365, rather than private applications hosted on-premises.
