## CompTIA A+ Certification Exam: Core 1 Sample Questions (Q130-Q135):

### NEW QUESTION # 130

A technician is setting up a new SOHO wireless router. According to security best practices, which of the following should the technician do first?

- A. Reset the router.
- **B. Change the default password.**
- C. Assign a static IP.
- D. Enable encryption.

**Answer: B**

Explanation:

The first security step after deploying a new router is to change the default administrative password. Default credentials are well known and pose a security risk if left unchanged.

From CompTIA A+ 220-1101 Official Study Guide, Objective 2.3 - Secure a wireless network:

"Always change default administrative credentials before further configuration to prevent unauthorized access." Verified Source: CompTIA A+ Core 1 (220-1101) Official Study Guide, Chapter 2: Wireless Security CompTIA Exam Objectives 220-1101, Domain 2.3

### NEW QUESTION # 131

A user reports slow internet browsing. The technician finds high CPU and memory usage, and pop-ups occur every minute. Which of the following should the technician do next?

- A. Escalate to the network team to check end-to-end connectivity.
- B. Check the wireless settings and validate the DHCP configuration.
- C. Download and install the latest drivers.
- **D. Update the anti-malware signatures and scan the system.**

**Answer: D**

Explanation:

Comprehensive and Detailed In-Depth Explanation:

High resource usage along with frequent pop-ups are strong signs of malware infection. The next logical step is to update anti-malware definitions and run a full scan to detect and remove threats.

\* Option A: Network performance is likely not the root cause - local system behavior points to malware.

\* Option B: Drivers affect hardware functionality; they don't resolve malware-related slowness.

\* Option D: DHCP issues usually cause IP conflicts or no network access, not CPU spikes or pop-ups.

CompTIA A+ Core 1 Exam Objective Reference:

\* Objective 4.2: Given a scenario, detect, remove, and prevent malware using appropriate tools and methods.

### NEW QUESTION # 132

A company is separating its accounting department's network from its customer service department's network. Which of the following will accomplish this task?

- A. VPN
- B. DNS
- **C. VLAN**
- D. DHCP

**Answer: C**

Explanation:

Comprehensive and Detailed Explanation From Exact Extract (Aligned With CompTIA A+ 220-1201 Study Guide) CompTIA networking fundamentals describe VLANs (Virtual Local Area Networks) as a method to segment network traffic logically, even while using the same physical switch hardware.

A VLAN allows a company to:

Separate traffic by department

Improve security

Reduce broadcast domains

Control inter-department access

To separate accounting and customer service networks, VLANs are the industry-standard and the CompTIA-approved method.

Why the other options are incorrect

A . VPN - Used for secure remote connections, not internal LAN segmentation.

B . DNS - Resolves hostnames to IPs, not used for network separation.

D . DHCP - Assigns IP addresses; does not isolate network groups.

### NEW QUESTION # 133

Which of the following ports should a technician disable to increase the security of remote connectivity?

- A. 0
- **B. 1**
- C. 2
- D. 3

**Answer: B**

Explanation:

Port 23 is used by Telnet, an unencrypted remote connection protocol that poses significant security risks. Disabling Telnet and using secure alternatives like SSH (port 22) is best practice.

From CompTIA A+ 220-1101 Official Study Guide, Objective 2.1 - Common ports and protocols:

"Port 23 (Telnet) provides unencrypted remote access and should be disabled to increase security. Use SSH (port 22) for secure remote connections." Verified Source:

### NEW QUESTION # 134

While reviewing options in the BIOS/UEFI settings page to fix a laptop issue, a support technician notices an option to clear existing TPM keys. Which of the following would most likely happen if the TPM is cleared?

- **A. Encrypted hard drives would probably not be accessible.**
- B. The device would need to be reenrolled in the MDM platform
- C. All security certificates would need to be reinstalled from trusted roots.
- D. The laptop would need to be registered to the domain as a new client.

**Answer: A**

Explanation:

The Trusted Platform Module (TPM) is a hardware-based security feature used to store cryptographic keys, such as those used for encryption, authentication, or device identification. It plays a critical role in ensuring secure operations for encrypted drives, BitLocker, and secure boot processes. Clearing TPM keys involves wiping all stored cryptographic data, which can lead to several consequences depending on what the TPM was being used for. Let's break it down:

Correct answer: A. Encrypted hard drives would probably not be accessible.

Encrypted hard drives, such as those secured with BitLocker encryption, rely on the cryptographic keys stored in the TPM to unlock data.

Clearing the TPM will erase these keys, making it impossible for the encrypted drive to decrypt its contents unless a recovery key (separate from the TPM) is available. Without this recovery key, the data will likely become inaccessible.

CompTIA A+ Core 1 Exam Objective Reference: This falls under Objective 3.5, which covers understanding BIOS/UEFI configurations, TPM functions, and securing devices.

Why the Other Options Are Incorrect:

B . All security certificates would need to be reinstalled from trusted roots.

Clearing the TPM does not erase security certificates stored in the operating system or other areas. Certificates are generally

managed by the OS or specific applications, not the TPM. Clearing the TPM only affects cryptographic keys and data stored in the TPM chip, so this is incorrect.

C . The device would need to be reenrolled in the MDM platform.

Mobile Device Management (MDM) enrollment typically does not rely on the TPM. While certain enterprise security configurations may involve the TPM, clearing it does not inherently trigger MDM reenrollment unless specifically tied to the MDM configuration.

D . The laptop would need to be registered to the domain as a new client.

While domain registrations may sometimes use TPM for authentication or secure operations, clearing the TPM alone does not require re-registering the device to the domain. The domain registration and authentication process rely more on system-level credentials than the TPM itself.

Practical Example:

A user enables BitLocker on their laptop, which relies on the TPM to store the encryption key. Later, if they clear the TPM via BIOS/UEFI without saving the BitLocker recovery key separately, they will not be able to unlock the hard drive, leading to data loss unless the recovery key is available. This is a common issue when technicians or users inadvertently clear the TPM without understanding its role in encryption.

CompTIA A+ Exam Objective Alignment:

Objective 3.5: Given a scenario, install and configure laptop hardware and components, including UEFI/BIOS security settings (TPM, secure boot, etc.).

This question tests understanding of TPM functionality, encryption technologies, and secure device configurations.
