問題 #27

An email developer is building a highly personalized email that must display a list of recommended products for a customer. The product data (name, image URL, price) is available as a 'listString' (an array of objects) on the customer's profile. When the developer tries to drag the product name field from the personalization picker into the email, it is disabled. Why is this happening and what must be done to render the list?

- A. The field is disabled because the developer does not have the correct permissions to use list-type fields.
- B. The field is disabled because lists cannot be used for personalization. The data must be flattened into separate attributes first.
- C. The field is disabled because the email template does not support list rendering.
- **D. The field is disabled because 'listString' fields can only be used in the advanced expression editor and require a "for each" loop to iterate through the items.**

答案： D

A marketing team is running a content experiment on an email's subject line to see which version drives more opens. They configure two treatments (A and B) and a holdout group. After the campaign runs, they review the results.

The report shows:

- Treatment A: 22% Open Rate, 95% Confidence
- Treatment B: 25% Open Rate, 98% Confidence
- Holdout: 15% Open Rate

How should the business practitioner interpret these results?

- A. The experiment is invalid because the holdout group's open rate is too low.
- B. Treatment B is the winner because it has the highest open rate and a confidence level above 95%.
- C. Treatment A should be chosen because its confidence level is exactly 95%.
- D. Neither treatment is a clear winner, and the test should be run again.
