

# Managing-Cloud-Security Exam Objectives, Valid Managing-Cloud-Security Exam Papers

## Managing Cloud Security - C838 Exam with Complete Answers

Broad network access - Answer-There should never be network bandwidth bottlenecks.

On-demand services - Answer-Refers to the model that allows customers to scale their compute and/or storage needs with little or no intervention from or prior communication with the provider.

Resource pooling - Answer-Characteristic that allows the cloud provider to meet various demands from customers while remaining financially viable.

measured/metered service - Answer-The customer is charged for only what they use and nothing more.

Business Impact Analysis (BIA) - Answer-An assessment of the priorities given to each asset and process within the organization

personally identifiable information (PII) - Answer-Under current laws, no cloud customer can transfer risk or liability associated with the inadvertent or malicious disclosure of <blank>.

Elasticity - Answer-This is the flexibility of allocating resources as needed for immediate usage, instead of purchasing resources according to other variables.

Simplicity - Answer-Usage and administration of cloud services ought to be transparent to cloud customers and users; from their perspective, a digital data service is paid for and can be used, with very little additional input other than what is necessary to perform their duties.

Scalability - Answer-The organization's computing needs won't remain static; there will be new (and hopefully more) users, customers, and data as the organization continually matures.

Infrastructure as a Service (IaaS) - Answer-The most basic of cloud service offerings, <blank> allows the customer to install all software, including operating systems (OSs) on hardware housed and connected by the cloud vendor.

Platform as a Service (PaaS) - Answer-<Blank> contains everything included in IaaS, with the addition of OSs.

Software as a Service (SaaS) - Answer-The cloud vendor becomes responsible for administering, patching, and updating software as well.

## Free PDF Quiz WGU - Managing-Cloud-Security –Professional Exam Objectives

These WGU Managing-Cloud-Security exam questions have a high chance of coming in the actual WGU Managing Cloud Security

(JY02) Managing-Cloud-Security test. You have to memorize these WGU Managing-Cloud-Security questions and you will pass the WGU Managing-Cloud-Security test with brilliant results. The price of WGU Managing-Cloud-Security updated exam dumps is affordable. You can try the free demo version of any WGU Managing Cloud Security (JY02) Managing-Cloud-Security exam dumps format before buying.

## WGU Managing Cloud Security (JY02) Sample Questions (Q195-Q200):

### NEW QUESTION # 195

Which legal framework is concerned with the privacy of data of EU/EEA citizens?

- A. HIPAA
- B. APPI
- C. COPPA
- **D. GDPR**

**Answer: D**

Explanation:

The General Data Protection Regulation (GDPR) is the legal framework concerned with the privacy of data belonging to citizens of the European Union and the European Economic Area (EU/EEA). Managing Cloud principles explain that GDPR establishes comprehensive rules governing the collection, processing, storage, and transfer of personal data.

GDPR applies to organizations both within and outside the EU/EEA if they process personal data of EU residents. It enforces strict requirements related to data protection, consent, breach notification, and individual rights. Cloud service providers and consumers must ensure compliance when handling EU personal data.

The other options apply to different jurisdictions or data types. HIPAA governs healthcare data in the United States, COPPA protects children's online privacy in the U.S., and APPI applies to Japan. Therefore, GDPR is the correct framework.

### NEW QUESTION # 196

An organization needs to provide space where security administrators can centrally monitor network traffic and events and respond to threats or outages. What should the organization create?

- A. Network operations center (NOC)
- **B. Security operations center (SOC)**
- C. Emergency response team (ERT)
- D. Disaster response team (DRT)

**Answer: B**

Explanation:

A Security Operations Center (SOC) is a centralized facility that allows administrators to monitor, detect, investigate, and respond to cybersecurity events in real time. SOC teams leverage tools such as SIEM (Security Information and Event Management), threat intelligence, and incident response playbooks.

ERTs and DRTs are teams focused on emergencies and disaster recovery, respectively, but they do not provide continuous monitoring. A NOC focuses on performance and availability of IT infrastructure but not on security threats.

By establishing a SOC, organizations ensure 24/7 visibility into security events, coordinated incident handling, and compliance with standards such as ISO 27001 and SOC 2. SOC's are essential in cloud environments where threats evolve rapidly, and centralized expertise is needed to minimize impact.

### NEW QUESTION # 197

Which item determines whether a server has the capacity and the instance allocation to meet a customer's requirements?

- A. Cloud provider
- B. Instance provider
- C. UniFi controller
- **D. Cloud controller**

**Answer: D**

Explanation:

The cloud controller determines whether a server has sufficient capacity and appropriate instance allocation to meet customer requirements. Managing Cloud principles explain that the cloud controller manages resource scheduling, provisioning, and allocation across the cloud infrastructure.

It evaluates available compute, memory, storage, and network resources before assigning workloads to physical or virtual servers. This ensures that customer requests are fulfilled without overcommitting resources or degrading performance.

A cloud provider delivers services, an instance provider is not a standard cloud role, and a UniFi controller manages networking devices. Therefore, the cloud controller is the correct answer.

#### NEW QUESTION # 198

Which phase of the cloud data lifecycle implements the file, block, or object type of cloud architecture?

- A. Archive
- B. Share
- C. Create
- **D. Store**

**Answer: D**

Explanation:

The Store phase of the cloud data lifecycle is responsible for maintaining data in cloud storage systems and is where file, block, and object storage architectures are implemented. Managing Cloud documentation explains that once data is created and prepared, it must be stored using appropriate storage technologies that support availability, durability, scalability, and performance requirements. File storage is commonly used for shared access and hierarchical file systems, block storage supports high- performance workloads such as databases and virtual machines, and object storage is optimized for scalability and unstructured data. All these storage models fall under the Store phase because they represent how data is retained and managed at rest within the cloud environment. The Archive phase focuses on long-term retention and cost optimization, often using cold or infrequent access storage. The Create phase is concerned with generating data, and the Share phase involves distributing data to other users or systems. None of these phases define the architectural storage models used to hold data.

Therefore, the Store phase is the correct answer, as it directly implements the underlying cloud storage architectures required to securely and efficiently manage data.

#### NEW QUESTION # 199

In which service model would the cloud service provider bear the greatest responsibility for security?

- **A. Software as a Service (SaaS)**
- B. Infrastructure as a Service (IaaS)
- C. Platform as a Service (PaaS)
- D. Database as a Service (DBaaS)

**Answer: A**

Explanation:

In the Software as a Service (SaaS) model, the cloud service provider bears the greatest responsibility for security. Managing Cloud documentation explains that in SaaS environments, the provider manages the application, operating system, middleware, infrastructure, and often many security controls.

Customers primarily focus on user access, data classification, and configuration of application-level settings, while the provider ensures platform availability, patching, vulnerability management, and infrastructure security. This shared responsibility model places the largest security burden on the provider in SaaS compared to other service models.

In PaaS and IaaS, customers assume increasing responsibility for securing operating systems, applications, and configurations. DBaaS still requires customer involvement in access control and data management.

Therefore, SaaS is the correct answer.

#### NEW QUESTION # 200

.....

We've always put quality of our Managing-Cloud-Security study guide on top priority. We don't strongly chase for the number of products we have manufactured. Each Managing-Cloud-Security test engine will go through strict inspection from many aspects such

as the operation, compatibility test and so on. Also, we have final random sampling survey before we sale our Managing-Cloud-Security practice material to our customers. The quality inspection process is completely strict. The most professional experts of our company will check the study guide and deal with the wrong parts. What you have bought will totally have no problem. That is why we can survive in the market now. Our company is dedicated to carrying out the best quality Managing-Cloud-Security Test Engine. Any small mistake is intolerant. You can buy our products at ease.
