- A. Cortex XSOAR
- B. AutoFocus
- C. Cortex XDR

### NEW QUESTION # 14

Which statement describes a host-based intrusion prevention system (HIPS)?

- A. It is placed as a sensor to monitor all network traffic and scan for threats.
- **B. It is installed on an endpoint and inspects the device.**
- C. It analyzes network traffic to detect unusual traffic flows and new malware.
- D. It scans a Wi-Fi network for unauthorized access and removes unauthorized devices.

**Answer: B**

Explanation:

A Host-Based Intrusion Prevention System (HIPS) is installed directly on an endpoint device (such as a server or workstation) and monitors local system activity, including processes, file access, and system calls, to detect and prevent malicious behavior.

### NEW QUESTION # 15

What is the definition of a zero-day threat?

- A. The amount of time it takes to discover a vulnerability and release a security fix
- B. The day a software vendor becomes aware of an exploit and prevents any further hacking
- **C. The period between the discovery of a vulnerability and development and release of a patch**
- D. A specific day during which zero threats occurred

**Answer: C**

Explanation:

A zero-day threat is an attack that takes advantage of a security vulnerability that does not have a fix in place.

It is referred to as a "zero-day" threat because once the flaw is eventually discovered, the developer or organization has "zero days" to then come up with a solution. A zero-day threat can compromise a system or network by exploiting the unknown vulnerability, and can cause data loss, unauthorized access, or other damages. Zero-day threats are difficult to detect and prevent, and require advanced security solutions and practices to mitigate them. References:

### NEW QUESTION # 16

On which security principle does virtualization have positive effects?

- A. integrity
- B. non-repudiation
- **C. availability**
- D. confidentiality

**Answer: C**

Explanation:

Virtualization improves the availability of IT systems and resources by enabling features such as:

\* Resource optimization: Virtualization allows multiple virtual instances to share the same physical infrastructure, reducing hardware costs and increasing resource utilization.

\* Scalability: Virtualization enables rapid provisioning and deprovisioning of virtual instances, allowing organizations to scale up or down their IT capacity according to demand.

\* Disaster recovery: Virtualization facilitates backup and replication of virtual instances, allowing organizations to restore their IT systems and data in the event of a disaster or outage.

\* Fault tolerance: Virtualization supports high availability and load balancing of virtual instances, ensuring that IT systems and services remain operational even if one or more virtual instances fail. ### NEW QUESTION # 17

Which two services does a managed detection and response (MDR) solution provide? (Choose two.)

- A. Periodic firewall updates
- **B. Incident impact analysis**

- C. Proactive threat hunting
- D. Improved application development

**Answer: B,C**

Explanation:

Managed Detection and Response (MDR) services combine incident impact analysis and proactive threat hunting to enhance organizational security posture. Incident impact analysis assesses the severity, scope, and potential damage of identified threats, helping prioritize responses. Proactive threat hunting involves skilled analysts searching for hidden threats that automated detection may miss, leveraging threat intelligence and behavioral analytics. Palo Alto Networks' MDR integrates Cortex XDR and human expertise to detect, investigate, and remediate sophisticated threats early. Unlike routine firewall updates or development processes, MDR is focused on active threat discovery and comprehensive incident management.
