CAD guide materials really attach great importance to the interests of users. In the process of development, it also constantly considers the different needs of users. According to your situation, our CAD study materials will tailor-make different materials for you. And the content of the CAD Exam Questions is always the latest information contained for our technicals update the questions and answers in the first time.

To become a ServiceNow CAD, candidates must pass a comprehensive certification exam that covers topics such as application design, development, testing, and deployment. CAD Exam also includes questions on integrations, security, data modeling, and user interface design. Candidates must demonstrate their proficiency in ServiceNow application development by passing the exam with a minimum score of 70%.

ServiceNow CAD certification is a valuable credential that demonstrates a developer's proficiency in developing and deploying applications on the ServiceNow platform. Certified Application Developer-ServiceNow certification provides a competitive edge in the job market, as it validates the skills and knowledge required to work on complex ServiceNow projects. Additionally, the certification provides access to the ServiceNow Developer Program, which offers resources, tools, and events to help developers stay up-to-date on the latest ServiceNow technologies.

## Well-Prepared CAD Reliable Braindumps Ebook – Fantastic Valid Test Guide for CAD: Certified Application Developer-ServiceNow

In the past few years, ServiceNow certification CAD exam has become an influenced computer skills certification exam. However, how to pass ServiceNow certification CAD exam quickly and simply? Our PassExamDumps can always help you solve this problem quickly. In PassExamDumps we provide the CAD Certification Exam training tools to help you pass the exam successfully. The CAD certification exam training tools contains the latest studied materials of the exam supplied by IT experts.

### ServiceNow Certified Application Developer-ServiceNow Sample Questions (Q225-Q230):

#### NEW QUESTION # 225

What section on the Notes tab, shows the history of the work documented on the record?

- **A. Activity Stream**
- B. Audit Log
- C. Diary
- D. Timeline
- E. Journal

**Answer: A**

#### NEW QUESTION # 226

When crafting a scoped application that contains flow actions, what is the application called?

- A. Action
- B. Flow
- **C. Spoke**
- D. Bundle

**Answer: C**

Explanation:

Comprehensive and Detailed Step-by-Step Explanation:

\* Definition of a Spoke: A "spoke" is a scoped application or component of an application that contains Flow Designer actions and integrations. Spokes provide reusable functionality and are typically used to extend the capabilities of Flow Designer.

\* Why It's Called a Spoke:

\* Spokes are part of the ServiceNow Flow Designer framework.

\* They contain predefined actions that are reusable across multiple flows. For example, an "Email Spoke" might include actions for sending emails or managing email configurations.

\* Why Other Options Are Incorrect:

\* Option B (Flow): This refers to an individual flow, not the application containing reusable actions.

\* Option C (Bundle): There is no such term as "Bundle" specific to Flow Designer in ServiceNow.

\* Option D (Action): While flows contain actions, the scoped application that houses these actions is referred to as a spoke.

References:

\* ServiceNow Developer Documentation on Flow Designer Spokes.

#### NEW QUESTION # 227

What field type would you select if you want to query records from another table on a form?

- A. Use the Date field type.
- **B. Use the Reference field type.**
- C. Use the Phone Number field type.
- D. Use the String field type.

**Answer: B**

Explanation:

In ServiceNow, to display data from another table within a form, the Reference field type is used. A Reference field creates a relationship between the current table and another table by storing a unique identifier (sys\_id) of a record from the referenced table. This allows users to select a record from the referenced table and access its data within the form. Therefore, the correct answer is B. The other field types do not provide this functionality:

\* A. Phone Number: This field type is designed to store phone numbers and does not create relationships between tables.

\* C. Date: This field type is used to store date values and does not reference records from other tables.

\* D. String: This field type stores text strings and does not facilitate querying records from another table.

For more detailed information, refer to the official ServiceNow documentation on Field Types.

#### NEW QUESTION # 228

Which of the following is a good practice for adding instructions to a form?

- **A. Annotations**
- B. A population read-only field
- C. A context Menu UI Action
- D. Related links to wiki pages

**Answer: A**

Explanation:

"Add instructional text and other design elements to your forms by using form annotations in Form Builder." <https://docs.servicenow.com/bundle/sandiego-application-development/page/administer/form-builder/ta>

#### NEW QUESTION # 229

Which one of the following is true for a Script Include with a Protection Policy value of Protected?

- **A. The Protection Policy is applied only if the application is downloaded from the ServiceNow App Store**
- B. The Protection policy option can only be enabled by a user with the admin role
- C. Any user with the protected\_edit role can see and edit the Script Include
- D. The Protection Policy is applied only if the glide.app.apply\_protection system property value is true

**Answer: A**

Explanation:

[https://docs.servicenow.com/bundle/rome-application-development/page/build/applications/concept/c\\_ScriptProtectionPolicy.html](https://docs.servicenow.com/bundle/rome-application-development/page/build/applications/concept/c_ScriptProtectionPolicy.html)

The following is true for a Script Include with a Protection Policy value of Protected:

The Protection Policy is applied only if the application is downloaded from the ServiceNow App Store. This is true because the Protection Policy is a feature that allows developers to protect their Script Includes from being viewed or modified by other users when they distribute their applications through the ServiceNow App Store. The Protection Policy is only enforced when the application is installed from the App Store, not when it is developed or tested on the instance.

The following are not true for a Script Include with a Protection Policy value of Protected:

Any user with the protected\_edit role can see and edit the Script Include. This is false because the protected\_edit role is not related to the Protection Policy, but to the Access Control (ACL) rules. The protected\_edit role allows users to edit protected fields on a table, such as the script field on the sys\_script table, which stores the Business Rules. The Protection Policy does not use roles to control access to the Script Includes, but a cryptographic key that is generated when the application is published to the App Store.

The Protection policy option can only be enabled by a user with the admin role. This is false because the Protection policy option can be enabled by any user who has the application\_admin role for the scoped application that contains the Script Include. The application\_admin role grants full access to the application development and administration within the scope of the application.

The Protection Policy is applied only if the glide.app.apply\_protection system property value is true. This is false because the glide.app.apply\_protection system property is not related to the Protection Policy, but to the Application Restricted Caller Access (ARCA) feature. The ARCA feature allows developers to restrict the access to the Script Includes from other applications based on the caller's scope. The glide.app.apply\_protection system property determines whether the ARCA feature is enabled or disabled on the instance.
