Questions (Q29-Q34):

NEW QUESTION # 29

What is a System Prompt?

- A. A System Prompt allows a user to describe its role, goals, and constraints while specifying rules and guidelines for actions, including the use of tools, escalations, and context.
- B. A System Prompt defines only the agent's constraints but does not address goal-setting or sequencing steps.
- C. A System Prompt is a technical script integrated into the automation process that determines tool usage and escalation protocols without considering natural language descriptions.
- D. A System Prompt is a predefined list of actions and commands the agent strictly follows without adaptation or interaction over time.

Answer: A

Explanation:

C is the correct answer - in UiPath's Agentic Automation framework, the System Prompt is a crucial configuration element that defines the agent's identity, objectives, behavioral rules, and tool usage logic.

It typically includes:

- * Agent Role: e.g., "You are a procurement assistant"
- * Goals: "Classify, summarize, or validate supplier quotes"
- * Constraints: e.g., "Don't exceed 100 words", "Only use escalation when criteria X is met"
- * Tool Usage: "Use Slack tool to notify team if X occurs"
- * Escalation Logic: "Escalate to human if confidence is below threshold"
- * Context Integration: "Use grounded context from ECS Index when available" This helps the LLM

behave consistently and transparently, even in unpredictable or complex workflows. It also acts as the starting configuration for the agent - informing every decision it makes during runtime.

Option A is incorrect - System Prompts are written in natural language, not code.

B is false - they allow for dynamic adaptation, especially when used with memory and tools.

D is incomplete - the system prompt does cover goals, constraints, and sequencing of steps.

Bottom line: the System Prompt is the "brain" behind the agent, telling it what to do, how to do it, when to act, and when to escalate - all in a natural language-driven, declarative format.

NEW QUESTION # 30

What is the defining characteristic of few-shot prompting?

- A. It relies on intermediate reasoning steps to guide the model's response.
- B. It requires the model to generate a response with no examples or instructions.
- C. It links multiple prompts together in a sequential workflow.
- D. It uses several examples to help the model understand the task better.

Answer: D

Explanation:

D is correct - the defining feature of few-shot prompting is the inclusion of multiple input-output examples within the prompt to demonstrate the desired behavior or output structure to the LLM.

In UiPath's Agentic Prompting practices, few-shot examples help:

- * Anchor the model to a consistent format
- * Reduce ambiguity in task instructions
- * Improve performance in tasks like classification, transformation, or content generation Example:

Input: "My password isn't working."

Output: "Category: Login Issue"

Input: "App won't open."

Output: "Category: Access Error"

This trains the model within the prompt - no fine-tuning required - making it a powerful design pattern in building intelligent agents.

Option A describes chain-of-thought prompting.

B refers to zero-shot prompting.

C refers to prompt chaining, used in advanced orchestration, not few-shot logic.

NEW QUESTION # 31

Why is an agent story important in the development life-cycle?

- A. A poorly defined agent story enables developers to identify improvement opportunities
- **B. A good agent story helps the developers who will build the agent to focus on the essential features that deliver value**
- C. An unclear agent story helps SMEs and stakeholders understand the potential risks associated with the agent
- D. A detailed agent story is only necessary when showcasing the agent's functionality to key stakeholders, rather than guiding the development process

Answer: B

Explanation:

The correct answer is D, and this is a foundational concept in UiPath's Agentic Discovery and Design Blueprint methodology.

An agent story serves as a clear, narrative-driven blueprint that describes:

- * What the agent does
- * For whom it works
- * When it activates
- * How it makes decisions
- * What success looks like

UiPath emphasizes that a well-crafted agent story ensures alignment between business stakeholders, subject matter experts (SMEs), and technical developers. It keeps the development team focused on value delivery by outlining the core capabilities, contextual behavior, and interactions of the agent in a human-readable form.

This approach is critical during the design phase, as it:

- * Prevents scope creep
- * Clarifies success metrics
- * Enhances stakeholder buy-in
- * Anchors prompt design, orchestration, and escalation logic

UiPath also uses the agent story to guide grounding strategies, tool selection, and even escalation paths - making it much more than a documentation artifact.

Options A, B, and C misrepresent the function of agent stories. Only D captures its value in focusing the team on what matters most for delivering real business outcomes.

NEW QUESTION # 32

When you want a connector field value to be inferred dynamically at run time, which input method should you select in the activity tool?

- **A. Argument**
- B. Clear value
- C. Prompt
- D. Static value

Answer: A

Explanation:

The correct answer is D - selecting "Argument" allows a field value in an activity (such as a connector or tool call) to be dynamically inferred at runtime, based on variables, agent state, or previous node outputs.

UiPath Autopilot™ and Studio Web use the "Argument" option in activity configuration to pass dynamic values, especially in agentic workflows where:

- * Outputs of one step must inform inputs of the next
- * Contextual reasoning or prompt outputs need to feed tool parameters
- * Escalation decisions or classifications affect API calls or record updates This is fundamental in making agent behavior adaptive and responsive to user context - a key trait of UiPath's agentic orchestration layer.

Other options:

- * A (Static value) is hardcoded
- * B (Clear value) wipes any existing input
- * C (Prompt) is used when engaging the LLM, not connectors

NEW QUESTION # 33

Which of the following best describes how agents handle dynamic environments?

- A. Agents adapt to changing conditions by learning.
- B. Agents rely solely on static rules without contextual learning.
- C. Agents require complete human assistance whenever processes change.
- D. Agents fail to execute tasks when information or processes change.

Answer: A

Explanation:

Bis correct - one of the defining strengths of UiPath's agentic automation is the ability for agents to adapt to dynamic environments using LLMs and contextual grounding.

Agents differ from traditional RPA bots in that they:

- * Interpret natural language
- * Reason across structured and unstructured data
- * Adjust outputs based on real-time context, grounding, and updated knowledge
- When processes change - such as updates to escalation rules, variations in incoming requests, or new product names - agents can adjust without reprogramming, thanks to:
- * Flexible prompts
- * Grounded context from indexes or memory
- * Few-shot or zero-shot inference capabilities

This adaptability makes agents ideal for scenarios like email triage, customer service, or knowledge work, where inputs and conditions vary.

Option A and D falsely suggest agents are rigid or fully dependent on human intervention.

Option C applies to classic RPA bots - not LLM-powered agents.

While agents don't "learn" in the ML retraining sense during execution, they dynamically interpret and adapt within the context of each session - a key feature enabled by UiPath's Autopilot™, Context Grounding, and agent memory frameworks.

This flexibility is foundational to deploying agents in environments where rules evolve, data flows shift, or human-like understanding is needed.
