## Palo Alto Networks Cloud Security Professional Sample Questions (Q207-Q212):

### NEW QUESTION # 207

During an initial deployment of Prisma Cloud Compute, the customer sees vulnerabilities in their environment. Which statement correctly describes the default vulnerability policy?

- A. It blocks containers after 30 days if they contain a critical vulnerability.
- B. **It alerts on all vulnerabilities, regardless of severity.**
- C. It alerts on any container with more than three critical vulnerabilities.
- D. It blocks all containers that contain a vulnerability.

**Answer: B**

Explanation:

By default, Prisma Cloud's vulnerability policy is configured to alert on all detected vulnerabilities across containers and images, without filtering based on the severity of the vulnerabilities. This default setting ensures that administrators are made aware of all potential security issues, providing them with comprehensive visibility into the security posture of their environment. Administrators can then assess and prioritize these vulnerabilities based on their context, severity, and impact on the organization's assets.

### NEW QUESTION # 208

Which two integrations enable ingesting host findings to generate alerts? (Choose two.)

- A. **Tenable**
- B. Splunk
- C. JIRA
- D. **Qualys**

**Answer: A,D**

Explanation:

To ingest host findings and generate alerts in Prisma Cloud, integrations with Tenable (B) and Qualys (D) are supported. These integrations allow Prisma Cloud to ingest vulnerability and compliance data from Tenable and Qualys, which are renowned vulnerability management solutions. By integrating these tools, Prisma Cloud can enhance its visibility into the security posture of hosts within the cloud environment, enabling more comprehensive threat detection and response capabilities. The integration facilitates the aggregation and correlation of findings from these external sources, enriching the overall security intelligence and enabling more informed and timely decision-making regarding threat mitigation and compliance management.

### NEW QUESTION # 209

A Prisma Cloud administrator is tasked with pulling a report via API. The Prisma Cloud tenant is located on app2.prismacloud.io. What is the correct API endpoint?

- A. <https://api.prismacloud.io>
- B. <https://api.prismacloud.cn>
- C. <https://api2.eu.prismacloud.io>
- D. **<https://api2.prismacloud.io>**

**Answer: D**

Explanation:

<https://prisma.pan.dev/api/cloud/api-urls/>

When accessing the Prisma Cloud API for a tenant located on app2.prismacloud.io, the correct API endpoint to use would be <https://api2.prismacloud.io>. This endpoint corresponds to the Prisma Cloud service instance hosted on app2.prismacloud.io, ensuring that API requests are directed to the correct instance of the service for processing. The use of api2 in the URL indicates that this is the second instance or a different geographical or functional partition of the Prisma Cloud service, which might be used for load balancing, redundancy, or serving different sets of users. It is crucial to use the correct endpoint corresponding to the Prisma Cloud console URL to ensure successful API communication and authentication.

#### NEW QUESTION # 210

An administrator has been tasked with creating a custom service that will download any existing compliance report from a Prisma Cloud Enterprise tenant.

In which order will the APIs be executed for this service?

(Drag the steps into the correct order of occurrence, from the first step to the last.)

#### NEW QUESTION # 211

A customer is reviewing Container audits, and an audit has identified a cryptominer attack. Which three options could have

generated this audit? (Choose three.)

- A. High CPU usage over time for the container is detected.
- B. The value of the mined currency exceeds \$100.
- C. Common cryptominer process name was found.
- D. The mined currency is associated with a user token.
- E. Common cryptominer port usage was found.

**Answer: A,C,E**

Explanation:

In the case of identifying a cryptominer attack through container audits, the options that could have generated this audit include B. High CPU usage over time for the container is detected, which is a common indicator of cryptomining activity as it consumes significant computational resources, C. Common cryptominer process name was found, which directly indicates the presence of cryptomining based on known malicious processes, and E. Common cryptominer port usage was found, suggesting cryptomining activity based on network behavior typical of such attacks.
