Cisco 800-150 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none"> • Networking Foundations: This section of the exam measures the skills of a Network Engineer and covers the basic building blocks of computer networking. It explains different types of networks like local area networks and wireless networks, and introduces lightweight wireless LANs. It describes the layers of communication models like the OSI model and TCP • IP stack, and explains how data moves across networks. It also discusses the physical cabling used in networks, such as Ethernet and fiber optics. Students will learn about network switching, IP addressing, subnetting, and routing at Layer 3. The section also introduces Cisco’s campus network devices, data center switches, UCS servers, and collaboration devices, describing their roles and functions in the network.
Topic 2	<ul style="list-style-type: none"> • Cisco Hardware Replacement: This section of the exam measures the skills of a Technical Support Engineer and teaches how to safely and correctly replace Cisco hardware. It explains safety procedures such as creating safe work zones and handling electrostatic discharge. Students learn the step-by-step processes to replace a wide range of Cisco devices, from switches and routers to firewalls, UCS servers, and collaboration endpoints. It also covers configuring Cisco NX-OS software, including understanding operating modes, boot procedures, and password recovery, and introduces Cisco collaboration endpoint solutions like IP phones and video systems.
Topic 3	<ul style="list-style-type: none"> • Cisco UCS and Data Center Architecture: This section of the exam measures the skills of a Data Center Engineer and introduces Cisco’s UCS and data center solutions. It explains the devices found in a data center, including switches, UCS servers, and director switches, and describes different server deployment models. Students will also learn about virtualization components like virtual machines, hypervisors, cloud computing concepts, and deployment models. The section covers how Cisco UCS devices fit into campus networks, edge locations, and data centers, and explains the key components and connections used in UCS architecture.

Topic 4	<ul style="list-style-type: none"> • Common Service Tasks and Tools: This section of the exam measures the skills of a Technical Support Engineer and focuses on tasks commonly needed to manage Cisco devices. It explains how devices boot up, introduces common Cisco IOS commands, and identifies tools for file management. It shows how to confirm physical connections, remotely access devices, and connect to the console port. It also covers how to capture the status of a device, recover passwords, and replace devices by using proper tools. Students are also taught how to find serial numbers on Cisco equipment to assist with support and maintenance activities.

Cisco Supporting Cisco Devices for Field Technicians Sample Questions (Q20-Q25):

NEW QUESTION # 20

Which common CLI command is used to install Cisco NX-OS Software?

- A. boot system
- B. install kickstart
- C. copy tftp: running-config
- **D. install all**

Answer: D

Explanation:

The `install all` command is the standard method used to install or upgrade Cisco NX-OS software on Nexus switches. This command streamlines the installation process by automating tasks such as verifying the software image, checking for compatibility, and managing the installation of optional packages or SMUs (Software Maintenance Upgrades). It ensures a comprehensive and efficient upgrade process, minimizing the potential for errors. Cisco In contrast:

* `copy tftp: running-configs` used to copy configuration files, not software images.

* `install kickstart` is an outdated command from earlier NX-OS versions.

* `boot system` sets the boot variable but does not handle the full installation process.

NEW QUESTION # 21

Which step must be performed immediately after disconnecting the network cable when replacing an SFP transceiver module?

- **A. Reinstall dust plugs in the optical bores.**
- B. Install the replacement SFP module.
- C. Disconnect the SFP latch.
- D. Observe the port status LED.

Answer: A

Explanation:

After disconnecting the network cable from an SFP transceiver, the immediate next step is to reinstall the dust plugs into the optical bores. This action prevents contamination from dust or debris that can damage the optical interfaces or degrade performance. It's important to protect the exposed optical port before handling the rest of the transceiver module. Dust plugs help maintain the integrity of the component until a new cable or module is connected.

NEW QUESTION # 22

Refer to the exhibit. Which component is highlighted on the Cisco I/O module image?

- A. fixed port
- B. captive screw
- **C. chassis connections LED**
- D. fan module LED

Answer: C

Explanation:

The highlighted component on the Cisco I/O module is the chassis connections LED, which indicates the status of connectivity between the I/O module and the chassis.

In the exhibit, the orange arrow points to a small rectangular LED indicator located to the left side of the I/O module (Cisco UCS-IOM-2304). This specific LED is not aligned with the ports, fans, or screws, which helps identify it correctly.

Chassis connections LED (B) is responsible for indicating the status of uplink/downlink communication between the I/O module and the chassis.

* Green usually indicates a healthy link.

* Amber or off may indicate a problem or no connection.

Why the other answers are incorrect:

* A. Captive screw# These are at the far corners, not where the arrow points.

* C. Fan module LED# This IOM doesn't have user-visible fan LEDs at the front face.

* D. Fixed port# These are the large rectangular SFP ports clearly visible in the middle, not near the arrow.

This identification is important when troubleshooting chassis-to-IOM connectivity or verifying module status LEDs during field maintenance.

NEW QUESTION # 23

D. Fixed port → These are the large rectangular SFP ports clearly visible in the middle, not near the arrow.

This identification is important when troubleshooting chassis-to-IOM connectivity or verifying module status LEDs during field maintenance.

NEW QUESTION # 24

Drag and drop the Cisco UCS components from the left onto the corresponding functionalities on the right.

Answer:

Explanation:

Explanation:

According to FLDTEC documentation and Cisco UCS architecture guides, each of these elements plays a distinct and essential role:
Fabric Interconnects (FI)- Act as the central switching and management point for the UCS domain, connecting servers to LAN and SAN.

Virtual Interface Cards (VICs)- Installed in servers, these adapters support virtualization of multiple NICs and HBAs, enabling dynamic profile assignment.

Fabric Extenders (FEXs)- Extend the I/O fabric from the FI to the chassis, reducing complexity and consolidating management.

Servers- Provide the actual compute resources and run workloads. These can be blade or rack servers housed in the UCS chassis. This structure is critical to the Cisco Unified Fabric approach, which simplifies data center management through integration and automation.
