Cisco Supporting Cisco Devices for Field Technicians Sample Questions (Q33-Q38):

NEW QUESTION # 33

What is the primary purpose of changing the configuration register when performing password recovery?

- A. To enable advanced debugging features
- B. To erase the entire configuration
- C. To ignore the startup configuration
- D. To unlock all user accounts

Answer: C

Explanation:

During password recovery on Cisco devices, the configuration register is modified to instruct the device to bypass the startup configuration stored in NVRAM. This allows administrators to access the device without being prompted for existing passwords. The standard procedure involves changing the configuration register value to 0x2142, which tells the device to ignore the startup configuration during the next boot. Once access is gained, the administrator can reset passwords and then restore the original configuration by resetting the configuration register to its default value, typically 0x2102.

NEW QUESTION # 34

Which key sequence is used to enter the boot prompt mode when the Cisco NX-OS Software begins the software boot process?

- A. Ctrl-C
- B. Ctrl-Z
- C. Ctrl-1
- D. Ctrl-X

Answer: A

Explanation:

During the boot process of Cisco devices running NX-OS, pressing Ctrl-C at the right time will interrupt the boot sequence and bring the system to the boot loader or ROMmon mode (commonly referred to as the boot prompt).

This allows a technician to perform low-level operations such as recovering passwords, specifying an alternate boot image, or performing diagnostics.

Other options (Ctrl-X, Ctrl-Z, Ctrl-1) are not used for interrupting the boot process in Cisco NX-OS platforms.

NEW QUESTION # 35

Which command is used to download a copied configuration file from a TFTP server to merge it with the running configuration of a replacement Cisco device?

- A. copy tftp: startup-config
- B. copy tftp: running-config
- C. merge tftp: running-config
- D. load tftp: running-config

Answer: B

Explanation:

The command copy tftp: running-config is used to retrieve a configuration file from a TFTP server and merge it with the current running configuration of a Cisco device. This operation is additive, meaning it integrates the new configuration commands into the existing running configuration without removing any pre-existing commands unless explicitly overridden.

This method is particularly useful when restoring configurations to a replacement device, as it allows for the seamless integration of necessary settings without disrupting the current operational state.

In contrast, using copy tftp: startup-config would overwrite the startup configuration file, which could lead to unintended consequences upon the next device reload. The options load tftp: running-config and merge tftp: running-config are not valid Cisco IOS commands.

NEW QUESTION # 36

Which two results are achieved by briefly pressing the restore/reset button on a Cisco Meraki switch? (Choose two.)

- A. A full factory restore is performed.
- B. The device reboots.
- C. The downloaded configuration is deleted.
- D. The management interface is cleared.
- E. Cloud management is disabled.

Answer: B,D

Explanation:

On a Cisco Meraki switch, briefly pressing the restore/reset button (typically less than 5 seconds) triggers:

A reboot of the device (Option A)

Clearing of the local management interface settings (Option D), which may include temporary network information such as DHCP leases or local overrides.

To perform a full factory reset (Option B), the button must be held down for a longer duration, usually more than 10 seconds.

Options C and E do not reflect standard reset behavior.

NEW QUESTION # 37

Which deployment scenarios are Cisco 8000 Series routers primarily designed for?

- A. small business and home office networks
- B. remote branch offices and retail locations
- C. service provider and web-scale networks
- D. campus LAN access and distribution layers

Answer: C

Explanation:

Cisco 8000 Series routers are primarily designed for service provider and web-scale networks, offering high-performance routing capabilities to handle large-scale, high-bandwidth environments typically found in service provider infrastructures and data centers. The Cisco 8000 Series routers are part of Cisco's high-performance routing portfolio. As documented in the official Cisco product and FLDTEC study materials:

Cisco 8000 Series routers are purpose-built for service provider and cloud-scale datacenters.

They are designed to support massive bandwidth, 5G core, and edge routing demands.

These routers provide scalable, high-performance architecture, using Cisco Silicon One ASICs, enabling terabits of throughput with advanced telemetry and network programmability.

Why the other options are incorrect:

A: Remote branches and retail typically use ISR/ASR 1000/1100 Series.

C: Home or small business networks use Cisco RV Series or Meraki MX Series.

D: LAN access/distribution layers in campuses commonly use Catalyst 9000 Series switches or ISR routers, not high-end core routers.

The 8000 Series is typically found in service provider core, data center interconnect, and hyperscale cloud deployments (e.g., Google, Meta, AWS).
