

IDP Interactive eBook & IDP Latest Study Questions

DOWNLOAD the newest Exam4Free IDP PDF dumps from Cloud Storage for free: <https://drive.google.com/open?id=1tYy5de2w0ZKG1vEwEsKUu6Tic8t1HEV1>

Holding a certification in a certain field definitely shows that one have a good command of the IDP knowledge and professional skills in the related field. However, it is universally accepted that the majority of the candidates for the IDP exam are those who do not have enough spare time and are not able to study in the most efficient way. You can just feel rest assured that our IDP Exam Questions can help you pass the exam in a short time. With our IDP study guide for 20 to 30 hours, you can pass the exam confidently.

Our IDP question torrent not only have reasonable price but also can support practice perfectly, as well as in the update to facilitate instant upgrade for the users in the first place, compared with other education platform on the market, the IDP Exam Question can be said to have high quality performance. We can sure that you will never regret to download and learn our IDP study material, and you will pass the IDP exam at your first try.

IDP Latest Study Questions | IDP Printable PDF

The software version of the IDP study materials is very practical. This version has helped a lot of customers pass their exam successfully in a short time. The most important function of the software version is to help all customers simulate the real examination environment. If you choose the software version of the IDP Study Materials from our company as your study tool, you can have the right to feel the real examination environment. In addition, the software version is not limited to the number of the computer.

CrowdStrike Certified Identity Specialist(CCIS) Exam Sample Questions (Q33-Q38):

NEW QUESTION # 33

Which of the following are NOT included within the three-dot menu on Identity-based Detections?

Which of the following are not included within the three-dot menu on Identity-based Detections?

- A. Add to Watchlist
- B. Edit status
- C. Add exclusion
- D. Add comment

Answer: A

Explanation:

In Falcon Identity Protection, the three-dot (#) action menu on an identity-based detection provides analysts with a limited set of actions that apply directly to the detection itself. According to the CCIS curriculum, these actions are designed to support investigation workflow, tuning, and documentation.

The supported actions in the detection-level three-dot menu include:

- * Edit status, which allows analysts to update the detection state (for example, New, In Progress, or Closed).
- * Add comment, which enables collaboration and documentation directly on the detection.
- * Add exclusion, where supported, to suppress future detections that match known benign behavior.

Add to Watchlist is not included in this menu because watchlists are applied to entities (such as users, service accounts, or endpoints), not to detections. Watchlists are managed from entity views or investigation workflows and are used to increase visibility and monitoring priority for specific identities—not to act on individual detections.

This distinction is emphasized in CCIS training to reinforce the separation between entity-centric actions and detection-centric actions. Because watchlists operate at the entity level, Option B is the correct and verified answer.

NEW QUESTION # 34

Describe the difference between a Human account and a Programmatic account.

- A. A human account is often used interactively
- B. A programmatic account is only used interactively
- C. A human account is an Administrator
- D. A programmatic account is never authorized for multi-factor authentication

Answer: A

Explanation:

Falcon Identity Protection differentiates human accounts and programmatic accounts based on authentication behavior, not naming conventions or assigned roles. According to the CCIS curriculum, human accounts are often used interactively, meaning they authenticate through direct user actions such as workstation logins, VPN access, or application access.

Programmatic accounts (such as service accounts) typically authenticate non-interactively, often on a predictable schedule or in response to automated processes. Falcon analyzes authentication frequency, protocol usage, timing, and access patterns to classify account types automatically.

The incorrect options reflect common misconceptions:

- * Human accounts are not always administrators.
- * Programmatic accounts can support MFA in some architectures.
- * Programmatic accounts are not used interactively.

Because interactive authentication behavior is the defining characteristic of human accounts, Option D is the correct and verified answer.

NEW QUESTION # 35

How should an organization address the domain risk score found in the Domain Security Overview page?

- A. Prioritizing the risks by severity, addressing the Low (Green) risks first
- B. Prioritizing the risks by severity, addressing the Medium (Yellow) risks first
- C. Address the risks on the list from top to bottom as risks are presented in a descending order
- D. Prioritizing the detections by severity, addressing the High (Red) detections first

Answer: C

Explanation:

The Domain Security Overview page in Falcon Identity Protection presents domain risks in a prioritized, descending order, based on a combination of severity, likelihood, and consequence. The CCIS curriculum emphasizes that organizations should address risks from top to bottom, as the list is already optimized to reflect the most impactful identity risks first.

This ordering allows security teams to focus remediation efforts where they will produce the greatest reduction in overall domain risk score. Addressing risks sequentially ensures alignment with Falcon's risk modeling and avoids misprioritization that could occur if teams focus only on color-based severity or individual detections.

The incorrect options reflect common misconceptions:

- * Medium risks should not be prioritized over higher-impact risks.
- * Detections are different from risks and should not be addressed independently of risk context.
- * Low risks are intentionally deprioritized by the platform.

By following the descending order provided in the Domain Security Overview, organizations align remediation with Falcon's Zero

Trust-driven identity risk scoring methodology, making Option A the correct answer.

NEW QUESTION # 36

What is the purpose behind creating Policy Rules?

- A. Policy Rules determine how the console tracks and learns behavior for users in the environment
- **B. Policy Rules determine what actions to take in response to certain triggers/conditions observed within the environment**
- C. Policy Rules determine the scope in which the sensor collects information on the environment
- D. Policy Rules determine what actions an admin in the console can take before making adjustments

Answer: B

Explanation:

Policy Rules in Falcon Identity Protection are designed to automate enforcement and response actions based on identity-related conditions observed in the environment. According to the CCIS curriculum, Policy Rules evaluate identity signals such as authentication behavior, risk levels, privilege status, and detection outcomes, then execute predefined actions when specific criteria are met.

These actions may include blocking authentication, enforcing MFA, generating alerts, or triggering Falcon Fusion workflows. This design supports Falcon's Zero Trust and continuous validation model, where trust decisions are dynamically enforced rather than statically assigned. Policy Rules therefore act as the operational bridge between identity analytics and enforcement.

The incorrect options confuse Policy Rules with other platform components. Administrative permissions are governed by RBAC, sensor data collection scope is controlled through configuration settings, and behavioral learning is handled by Falcon's analytics engine—not Policy Rules.

The CCIS documentation explicitly defines Policy Rules as logic-based enforcement mechanisms, making Option A the correct and verified answer.

NEW QUESTION # 37

How long does it typically take Falcon Identity to develop a baseline of a user?

- A. One month
- B. Two weeks
- **C. One week**
- D. Three months

Answer: C

Explanation:

Falcon Identity Protection establishes a user baseline by observing authentication behavior over time, including login frequency, endpoints used, access patterns, and protocol usage. According to the CCIS curriculum, Falcon typically requires approximately one week of consistent activity to develop an initial, reliable baseline for a user.

This baseline allows Falcon to distinguish normal behavior from anomalies and to calculate accurate risk scores. While the baseline continues to mature over time and becomes more precise with additional data, the first usable behavioral model is generally formed within a week.

Longer timeframes such as one or three months are not required to begin detecting abnormal behavior.

Conversely, periods shorter than a week may not provide sufficient behavioral data to accurately model normal usage patterns.

Because Falcon can rapidly establish a functional baseline while continuously refining it, Option C (One week) is the correct and verified answer.

NEW QUESTION # 38

.....

Exam4Free has formulated IDP PDF questions for the convenience of CrowdStrike IDP test takers. This format follows the content of the CrowdStrike IDP examination. You can read CrowdStrike IDP Exam Questions without the limitations of time and place. There is also a feature to print out CrowdStrike IDP exam questions.
