Managing Cloud Security - C838 - Final Review Questions and Verified Answers

When is the MOST optimal time to determine if data is classified as secure?

The Creation phase is the most optimal time to classify data as secure. When data is created during the create phase, the sensitivity of the data is known.

Discretionary Access Control (DAC)

DAC is when the owner of the document is responsible for defining the limits on a per-document basis.

PII - Direct Identifiers & Indirect Identifiers

Indirect Identifiers - General information, requires more research to id person

Direct Identifiers - Specific. Directly id a person

Block Storage Characteristics

> Files are stored as sectors on a drive

> Format of virtual machine disks

> VMs and servers use this type of storage

> Database will store files on this type of storage

> Storage is in a hierarchical structure

Similarly, the Lead2Passed WGU Managing-Cloud-Security practice test creates an actual exam scenario on each and every step so that you may be well prepared before your actual WGU Managing Cloud Security (JY02) examination time. Hence, it saves you time and money. Lead2Passed provides three months of free updates if you purchase the WGU Managing-Cloud-Security Questions and the content of the examination changes after that.

With the rise of internet and the advent of knowledge age, mastering knowledge about computer is of great importance. This Managing-Cloud-Security exam is your excellent chance to master more useful knowledge of it. Up to now, No one has questioned the quality of our Managing-Cloud-Security training materials, for their passing rate has reached up to 98 to 100 percent. Our Courses and Certificates study dumps are priced reasonably so we made a balance between delivering satisfaction to customers and doing our own jobs. So in this critical moment, our Managing-Cloud-Security real materials will make you satisfied. Our Managing-Cloud-Security exam materials can provide integrated functions. You can learn a great deal of knowledge and get the certificate of the exam at one order like win-win outcome at one try.

Examinations Managing-Cloud-Security Actual Questions - Managing-Cloud-Security Pdf Braindumps

As one of the hot exam of our website, WGU dumps pdf has a high pass rate which reach to 85%. According to our customer's feedback, our Managing-Cloud-Security vce braindumps covers mostly the same topics as included in the real exam. So if you practice our Managing-Cloud-Security Test Questions seriously and review test answers, pass exam will be absolute.

WGU Managing Cloud Security (JY02) Sample Questions (Q144-Q149):

NEW QUESTION # 144

Which threat modeling process would a security analyst use to test a new application from a malicious actor's perspective?

- A. Spoofing, Tampering, Repudiation, Information Disclosure, Denial of Service, and Elevation of Privileges (STRIDE)
- B. Damage, Reproducibility, Exploitability, Affected Users, and Discoverability (DREAD)
- C. Architecture, Threats, Attack Surfaces, and Mitigation (ATASM)
- **D. Process for Attack Simulation and Threat Analysis (PASTA)**

Answer: D

Explanation:

The Process for Attack Simulation and Threat Analysis (PASTA) is a risk-centric threat modeling methodology that explicitly focuses on simulating real-world attacks from an adversary's perspective. Unlike STRIDE or DREAD, which classify threats and rate severity, PASTA evaluates how an attacker would exploit vulnerabilities step by step.

PASTA has seven stages, including defining objectives, decomposing applications, and simulating attacks.

This methodology helps organizations understand both technical and business risks by looking at the application as an attacker would.

STRIDE categorizes threats, DREAD provides scoring, and ATASM emphasizes architecture and mitigation.

While valuable, they are not primarily attack-simulation frameworks. PASTA enables proactive testing of defenses against realistic adversary behaviors, making it especially relevant in modern cloud and DevSecOps environments.

NEW QUESTION # 145

An organization is undergoing an ISO 27001 audit that includes a software as a service (SaaS) solution within scope, and the auditor has requested evidence of controls. What evidence should the organization provide the auditor?

- A. Operating system patch logs
- **B. Provider compliance attestation**
- C. Network firewall rules
- D. Physical diagram of the data center

Answer: B

Explanation:

When a SaaS solution is included within the scope of an ISO 27001 audit, the organization should provide the cloud provider's compliance attestation as evidence of controls. Managing Cloud guidance explains that in the SaaS model, the provider manages infrastructure, platform, and application-level controls.

Because customers do not manage operating systems, firewalls, or physical data centers in SaaS, they cannot supply direct technical evidence for those controls. Instead, third-party audit reports and attestations demonstrate that the provider has implemented appropriate security controls.

Firewall rules, OS patch logs, and physical diagrams are not accessible to SaaS customers. Therefore, provider compliance attestation is the correct evidence.

NEW QUESTION # 146

How does a cloud-based distributed denial-of-service (DDoS) protection strategy help in the event of an attack?

- **A. Rerouting traffic to the mitigation services**
- B. Having multiple endpoints
- C. Using round-robin load balancing
- D. Scaling the receiving application

Answer: A

Explanation:

A cloud-based DDoS protection strategy helps mitigate attacks by rerouting traffic to specialized mitigation services. Managing Cloud guidance explains that cloud providers leverage large-scale, distributed infrastructures capable of absorbing and filtering massive volumes of malicious traffic.

When an attack is detected, traffic is redirected to scrubbing centers or mitigation platforms that analyze and filter malicious packets before forwarding legitimate traffic to the target application. This prevents backend systems from becoming overwhelmed and ensures service availability.

The other options provide limited protection. Load balancing and multiple endpoints distribute traffic but do not filter attacks, and scaling applications may still fail under volumetric attacks. Therefore, rerouting traffic to mitigation services is the most effective strategy.

NEW QUESTION # 147

Which technique is used to count source and destination internet protocol (IP) addresses in incoming log flow across all log sources?

- A. Frequency
- B. Time
- C. Software error
- D. Baseline

Answer: A

Explanation:

Frequency analysis is the technique used to count source and destination IP addresses in incoming log flows across multiple log sources. Managing Cloud principles explain that frequency-based analysis evaluates how often specific events, IP addresses, or actions occur within collected log data.

By counting the number of times an IP address appears as a source or destination, security teams can identify anomalies such as distributed scanning, brute-force attacks, or denial-of-service activity. Frequency analysis is commonly used within SIEM platforms to correlate logs from firewalls, servers, applications, and network devices.

The other options do not perform this function. Software error refers to application faults, time-based analysis focuses on event duration or timestamps, and baseline establishes normal behavior patterns rather than counting occurrences. Therefore, frequency is the correct technique.

NEW QUESTION # 148

Which privacy issue does the Clarifying Lawful Overseas Use of Data (CLOUD) Act address?

- A. Conflicting regulations in different jurisdictions
- B. Use of digital surveillance by multinational employers
- C. Data breach notification requirements
- D. Collection and use of genetic information

Answer: A

Explanation:

The CLOUD Act addresses conflicts that arise when law enforcement in one jurisdiction seeks access to data stored in another country. It clarifies how U.S. authorities can compel cloud providers to produce data, even if stored overseas, and establishes a framework for resolving jurisdictional conflicts through bilateral agreements.

The Act does not regulate genetic data, breach notifications, or employer surveillance. Its central purpose is to handle the challenge of cross-border data access in the era of globalized cloud computing.

For organizations, this means carefully evaluating how and where data is stored, and ensuring contracts and compliance strategies account for potential conflicts between U.S. law and foreign privacy regulations like GDPR. Awareness of CLOUD Act obligations is crucial in multinational cloud deployments.
