Latest 220-1102 Exam Review - 220-1102 New Guide Files

It doesn't matter if it's your first time to attend 220-1102 practice test or if you are freshman in the IT certification test, our latest

220-1102 dumps guide will boost you confidence to face the challenge. Our dumps collection will save you much time and ensure you get high mark in 220-1102 Actual Test with less effort. Come and check the free demo in our website you won't regret it.

CompTIA 220-1102, or the CompTIA A+ Certification Exam Core 2, is an industry-standard certification exam that validates the skills and knowledge required to become an IT professional. 220-1102 exam focuses on the basics of installation, configuration, and troubleshooting of PCs, mobile devices, and software. 220-1102 Exam is designed to test the candidate's ability to work with hardware, software, networks, and security.

CompTIA A+ Certification Exam: Core 2 Sample Questions (Q482-Q487):

NEW QUESTION # 482

An implementation specialist is replacing a legacy system at a vendor site that has only one wireless network available. When the specialist connects to Wi-Fi, the specialist realizes the insecure network has open authentication. The technician needs to secure the vendor's sensitive data. Which of the following should the specialist do FIRST to protect the company's data?

- A. Change the network location to private.
- B. Manually configure an IP address, a subnet mask, and a default gateway.
- C. Configure MFA on the network.
- **D. Connect to the vendor's network using a VPN.**

Answer: D

Explanation:

The first thing that the specialist should do to protect the company's data on an insecure network with open authentication is to connect to the vendor's network using a VPN. A VPN stands for Virtual Private Network and is a technology that creates a secure and encrypted connection over a public or untrusted network. A VPN can protect the company's data by preventing eavesdropping, interception or modification of the network traffic by unauthorized parties. A VPN can also provide access to the company's internal network and resources remotely. Manually configuring an IP address, a subnet mask and a default gateway may not be necessary or possible if the vendor's network uses DHCP to assign network configuration parameters automatically. Manually configuring an IP address, a subnet mask and a default gateway does not protect the company's data from network attacks or threats. Changing the network location to private may not be advisable or effective if the vendor's network is a public or untrusted network. Changing the network location to private does not protect the company's data from network attacks or threats. Configuring MFA on the network may not be feasible or sufficient if the vendor's network has open authentication and does not support or require MFA. Configuring MFA on the network does not protect the company's data from network attacks or threats. References: CompTIA A+ Core 2 (220-1102) Certification Exam Objectives Version 4.0, Domain 3.3

NEW QUESTION # 483

A technician is troubleshooting an issue involving programs on a Windows 10 machine that are loading on startup but causing excessive boot times. Which of the following should the technician do to selectively prevent programs from loading?

- **A. Open the Startup tab and methodically disable items currently listed as enabled and reboot, checking for issue resolution at each startup.**
- B. Right-click the Windows button, then select Run entering shell startup and clicking OK, and then move items one by one to the Recycle Bin
- C. Remark out entries listed
HKEY_LOCAL_MACHINE>SOFTWARE>Microsoft>Windows>CurrentVersion>Run
- D. Manually disable all startup tasks currently listed as enabled and reboot checking for issue resolution at startup

Answer: A

Explanation:

Explanation

This is the most effective way to selectively prevent programs from loading on a Windows 10 machine. The Startup tab can be accessed by opening Task Manager and then selecting the Startup tab. From there, the technician can methodically disable items that are currently listed as enabled, reboot the machine, and check for issue resolution at each startup. If the issue persists, the technician can then move on to disabling the next item on the list.

NEW QUESTION # 484

A technician is trying to encrypt a single folder on a PC. Which of the following should the technician use to accomplish this task?

- A. EFS
- B. exFAT
- C. FAT32
- D. BitLocker

Answer: A

Explanation:

EFS (Encrypting File System) is a feature that allows a user to encrypt a single folder or file on a Windows PC. It uses a public key encryption system to protect the data from unauthorized access. FAT32 and exFAT are file system formats that do not support encryption. BitLocker is a feature that encrypts the entire drive, not a single folder or file. Verified References:

NEW QUESTION # 485

A technician is configuring a specific NTP server for all company-issued laptops. These Windows 10 machines are not joined to an Active Directory domain. Which of the following setting areas would be used for this adjustment?

- A. Network and Internet
- B. System
- C. Time and Language
- D. Update and Security

Answer: C

Explanation:

Comprehensive and Detailed In-Depth Explanation: To configure an NTP (Network Time Protocol) server, navigate to Time and Language > Date & Time settings in Windows 10.

- * A. System - Incorrect. This manages system settings but not time synchronization.
- * B. Update and Security - Incorrect. This controls Windows updates and security settings.
- * C. Network and Internet - Incorrect. This is for networking settings, not time sync.
