Questions (Q10-Q15):

NEW QUESTION # 10

A customer wants to upgrade a VSP 5500 to a VSP 5600. Which two actions are required for this upgrade? (Choose two.)

- A. Replace all the memory DIMMs.
- B. Replace the CPUs on all the controller boards.
- C. Replace all the controller boards.
- D. Replace all the Power Supplies with more powerful ones.

Answer: C,D

Explanation:

Replace all the controller boards.

Upgrading from VSP 5500 to VSP 5600 requires installing new controller boards, as the 5600 uses a different and more advanced controller architecture.

Replace all the Power Supplies with more powerful ones.

The upgrade also requires replacing the power supplies with models that are compatible with and can support the power requirements of the VSP 5600 controllers.

NEW QUESTION # 11

You need to install an iSCSI channel board feature on a VSP 5500 system. Which two steps are required? (Choose two.)

- A. Physically install the pair of channel boards in any available slot.
- B. Use the Maintenance Utility to add the boards to the system configuration.
- C. Physically install the pair of channel boards in the appropriate slots.
- D. Use the Maintenance Utility (Sub Panel) of the VSP GUI to assign ports to the added boards.

Answer: B,C

Explanation:

Physically install the pair of channel boards in the appropriate slots.

Channel boards must be installed in specific, designated slots to ensure proper system recognition and redundancy.

Use the Maintenance Utility to add the boards to the system configuration.

After installation, the Maintenance Utility is used to logically add and configure the new channel boards within the system.

NEW QUESTION # 12

Which statement is correct regarding the Interconnect Switches (ISWs) on VSP 5000 systems?

- A. ISWs are standalone, optional switches that can be used for both network and data path.
- B. ISWs are switches that provide redundancy for data path and they are only used when the number of CBX pairs is higher than two.
- C. ISWs are switches that route data between nodes and they are located on each controller of the node.
- D. ISWs are switches that route data between nodes using Hitachi Interconnect Edge and X-Path cables, and they are located on the Hitachi Service and Network Boxes (HSNBXs).

Answer: A

Explanation:

The Interconnect Switches on a VSP 5000 are delivered as standalone 1 U switch chassis that house both the PCIe "interconnect" modules (for routing data between controller nodes) and an Ethernet switch (for management/network traffic), so they serve both network and data-path roles.

NEW QUESTION # 13

How many Channel Boards (CHBs) can be installed in a VSP 5600 with two CBX?

- A. 0
- B. 1

- C. 2
- D. 3

Answer: A

Explanation:

In a VSP 5600 system configured with two Controller Boxes (CBXs), you can install up to 16 Channel Boards (CHBs) in total. Each CBX can accommodate up to 8 CHBs, resulting in a combined maximum of 16 CHBs for the system. This configuration allows for scalable host connectivity options, supporting various protocols such as Fibre Channel, iSCSI, and FICON.

NEW QUESTION # 14

Which document is essential to review before starting the pre-installation process for a VSP 5000 storage system?

- A. The latest software compatibility list
- B. The annual maintenance contract
- C. The installation site requirements
- D. The customer service plan

Answer: C

Explanation:

Before beginning the pre-installation process for a Hitachi VSP 5000, it is crucial to review the installation site requirements. This ensures that the physical environment is suitable for the system and meets operational standards. Key factors include:

Rack space and floor loading for the storage system

Power requirements (voltage, redundancy, and distribution)

Cooling and airflow specifications

Network connectivity requirements

Environmental considerations such as humidity, temperature, and dust control Reviewing this document helps avoid delays, prevent equipment damage, and ensures a smooth installation.
