Fortinet NSE 5 - FortiSwitch 7.6 Administrator Sample Questions (Q110-Q115):

NEW QUESTION # 110

Exhibit.

You need to manage three FortiSwitch devices using a FortiGate device. Two of the FortiSwitch devices initiated a reboot after the authorization process. However, the FortiSwitch device with the configuration shown in the exhibit, did not reboot All three devices completed FortiLink management authorization successfully.

Why did the FortiSwitch device shown in the exhibit not reboot to complete the authorization process?

The management mode was set to use FortiLink mode.

- A. The system time is not in-sync and is using a non-default value
- B. Switch auto-discovery is enabled.
- C. The management mode was set to use FortiLink mode.
- D. The FortiSwitch device is scheduled to reboot as part the authorization process

Answer: C

Explanation:

Regarding the scenario where a FortiSwitch did not reboot after the authorization process while the other devices did, the most likely cause, given the configuration settings in the exhibit, is:

* The management mode was set to use FortiLink mode (Option B): If the FortiSwitch was already configured to use FortiLink for its management mode, it may not require a reboot to complete the authorization process as its management interface settings are already aligned with FortiLink requirements. This is unlike switches that might be transitioning from a standalone or another management mode, which would typically require a reboot to apply new management settings fully.

References:

FortiLink mode specifically tailors FortiSwitch to be managed via a FortiGate device, integrating its operation into the wider security fabric without needing a reboot if it is already set to this mode before authorization.

This contrasts with other management modes where transitioning to FortiLink could necessitate a system restart to initialize the new configuration.

NEW QUESTION # 111

How are the 'by VLAN redirect MAC address quarantine' mode and the 'by redirect MAC address quarantine' mode on FortiGate similar?

- A. Both modes require firewall policies to block inter-VLAN traffic.
- B. Both modes add quarantined device MAC addresses to the blocked firewall address group.
- **C. Both modes move quarantined devices to the quarantine VLAN.**
- D. Both modes block intra-VLAN traffic by FortiGate automatically.

Answer: C

Explanation:

The 'by VLAN redirect MAC address quarantine' mode and the 'by redirect MAC address quarantine' mode on FortiGate share specific similarities:

* Quarantine VLAN Assignment (A):

* Common Feature: Both modes utilize a designated quarantine VLAN to isolate quarantined devices. This helps in mitigating the risk of spreading potential security threats within the network.

* Operational Impact: Moving devices to a specific quarantine VLAN restricts their network access, effectively isolating them until further action or remediation is taken.

NEW QUESTION # 112

Which two statements about VLAN assignments on FortiSwitch ports are true? (Choose two.)

- A. Configure a native VLAN on the FortiLink
- B. Assign an IP address and subnet mask to FortiSwitch VLANs
- **C. Assign untagged VLANs using FortiGate CLI**
- **D. Only assign one native VLAN on a port**

Answer: C,D

Explanation:

VLAN assignments on FortiSwitch ports must follow certain rules and guidelines to ensure network integrity and proper traffic segregation:

* Only Assign One Native VLAN on a Port (C):

* Native VLAN Configuration: Each switch port can have only one native VLAN. The native VLAN carries untagged traffic for that port. If the port receives untagged frames, they are assumed to belong to the native VLAN.

* Importance of Singular Native VLAN: This is crucial for preventing VLAN hopping attacks and ensures clear and secure VLAN demarcation on each port.

* Assign Untagged VLANs Using FortiGate CLI (D):

* CLI Configuration: Untagged VLANs, often equivalent to the native VLAN, can be assigned through the FortiGate CLI when managing a FortiSwitch via FortiLink. This allows for central management and configuration of VLANs across connected switches.

* Operational Efficiency: Using the CLI ensures that VLAN settings are applied uniformly, reducing the likelihood of misconfigurations that might occur when managing VLANs individually on each switch.

NEW QUESTION # 113

An administrator must deploy managed FortiSwitch devices in a remote location where multiple VLANs must be used to segment devices. No layer 3 switch or router is present at the site, and the only WAN connectivity is an ISP-provided router connected to the public internet. Which two components are required to enable VLAN segmentation across this remote site? (Choose two answers)

- A. A layer 3 router at the remote location to handle inter-VLAN routing
- B. A FortiSwitch model that supports VXLAN hardware acceleration
- C. FortiGate with a layer 3 interface to terminate the VXLAN overlay
- D. FortiSwitch and FortiGate devices configured with IPsec interfaces
- E. FortiGate and FortiSwitch configured with VXLAN to tunnel VLANs over the WAN

Answer: C,E

Explanation:

According to the FortiOS 7.6 Administration Guide and the FortiSwitch 7.6 FortiLink Guide, deploying managed switches over a Layer 3 underlay—such as the public internet—requires a specific tunneling mechanism to bridge Layer 2 broadcast domains. Traditional FortiLink relies on a direct Layer 2 connection; however, for remote sites, FortiLink over VXLAN is the standard solution.

* FortiLink over VXLAN (Option A): Virtual Extensible LAN (VXLAN) is used to encapsulate Layer 2 Ethernet frames into Layer 3 UDP packets, allowing VLAN-tagged traffic to traverse an ISP's routable network. This enables the FortiGate to manage remote FortiSwitch "islands" as if they were locally connected, maintaining full VLAN segmentation across the WAN.

* Layer 3 Termination (Option E): The FortiGate acts as the Virtual Tunnel Endpoint (VTEP). It must have a reachable Layer 3 interface (such as a WAN port with a public IP or an IPsec tunnel interface) to terminate the VXLAN overlay. Once the VXLAN tunnel is terminated at the FortiGate, the encapsulated VLAN traffic is extracted, and the FortiGate can perform inter-VLAN routing and security inspection.

Regarding the incorrect options: Option B is incorrect because the FortiGate at the central site handles the routing, eliminating the need for a local L3 device. Option C is a performance consideration but not a functional requirement for basic connectivity. Option D is often used for security to encrypt the underlay, but IPsec alone does not provide the Layer 2 extension capabilities required for VLAN segmentation; VXLAN is the specific component that handles the MAC-in-UDP encapsulation.

NEW QUESTION # 114

Which statement about using MAC, IP, and protocol-based VLANs on FortiSwitch is true?

- A. Endpoints are required to use the same FortiSwitch port to remain members of the VLAN.
- B. FortiSwitch uses only the Ethernet type to assign traffic to VLANs.
- C. It provides benefits that can be obtained when using 802.1X authentication.
- D. It is a scalable and secure solution in comparison to other Layer 2 security measures.

Answer: C

Explanation:

It provides benefits that can be obtained when using 802.1X authentication (C): MAC, IP, and protocol-based VLANs on FortiSwitch are beneficial in network environments where additional granularity is needed in traffic segmentation and security, similar to what can be achieved through 802.1X authentication. These VLAN types allow for dynamic assignment of ports to VLANs based on the characteristics of the incoming traffic, enhancing both security and network efficiency.
