# 2026 Reliable Integration-Architect Braindumps Questions 100% Pass | Latest Authorized Integration-Architect Exam Dumps: Salesforce Certified Integration Architect

What's more, part of that PrepPDF Integration-Architect dumps now are free: https://drive.google.com/open?id=1rug30ETkd8TeEhIKArBTHrzTp7czIHml

Have tough-minded boy only, ability appeases billows, hoist the sails Yuan Hang. Our Salesforce Integration-Architect exam dumps are the first step to bring you achievement. It provides you with pdf real questions and answers. By choosing it, you must put through Salesforce Integration-Architect Certification that other people think it is very difficult. After you get the certification, you can lighten your heart and start a new journey.

The Salesforce Integration-Architect exam measures the candidate's ability to design and implement scalable, reliable, and secure integration solutions that meet the business requirements of the clients. Integration-Architect exam is designed for experienced professionals who have a deep understanding of the Salesforce platform and the integration technologies that are used to connect Salesforce with other systems. Salesforce Certified Integration Architect certification is highly valued by employers as it demonstrates the candidate's expertise in implementing integration solutions that are critical for the success of their business operations. The Salesforce Integration-Architect certification is a must-have for professionals who want to advance their careers in the IT industry and become experts in integration architecture.

To become a Salesforce Integration-Architect Certified professional, you must pass the Integration-Architect certification exam. Integration-Architect exam is divided into two parts: the multiple-choice exam and the scenario-based exam. The multiple-choice exam consists of 60 multiple-choice questions that cover topics such as integration architecture, integration design patterns, and

integration security. The scenario-based exam consists of five scenarios that test your ability to design and implement complex integrations.

Authorized Salesforce Integration-Architect Exam Dumps, Integration-Architect Reliable Test Topics

Although a lot of products are cheap, but the quality is poor, perhaps users have the same concern for our Integration-Architect learning materials. Here, we solemnly promise to users that our product error rate is zero. Everything that appears in our products has been inspected by experts. In our Integration-Architect learning material, users will not even find a small error, such as spelling errors or grammatical errors. It is believed that no one is willing to buy defective products, so, the Integration-Architect study materials have established a strict quality control system.

Salesforce Certified Integration Architect Sample Questions (Q41-Q46):

NEW QUESTION # 41
Universal Containers is a global financial company that sells financial products and services.
There is a daily scheduled Batch Apex job that generates invoice from a given set of orders.
UC requested building a resilient integration for this batch apex job in case the invoice generation fails.
What should an integration architect recommend to fulfill the requirement?

- A. Batch Retry & Error Handling report to monitor the error handling.
- B. Build Batch Retry & Error Handling using BatchApexErrorEvent.
- C. Build Batch Retry & Error Handling in the middleware.
- D. Build Batch Retry & Error Handling in the Batch Apex Job itself.

Answer: B

Explanation:
Explanation
The BatchApexErrorEvent object allows handling errors that occur during Batch Apex execution. By subscribing to this event, the integration can retry the invoice generation for the failed records or perform other recovery actions. This is a resilient and scalable solution that does not require custom code in the Batch Apex job itself or in the middleware1

NEW QUESTION # 42
Northern Trail Outfitters' (NTO) Salesforce org usually goes through 8k-10k batches a day to synch data from external sources.
NTO's Integration Architec has received requirements for a new custom object, FooBarc, for which 90M records will need to be loaded into the org. Once complete, 20GB (about 30M records) needs to be extracted to an external auditing system.
What should the architect recommend using to meet these requirements in a day?

- A. Insert using Bulk API 2.0 and query using REST API.
- B. Insert and query using Bulk API 1.0.
- C. Insert using Bulk API 1.0 and query using REST API.
- D. Insert and query using Bulk API 2.0.

Answer: D

NEW QUESTION # 43
Customer is evaluating Platform Events solution and would like help in comparing/contrasting it with Outbound Message for a real-time / near-real time needs. They expect 3,000 consumers of messages from Salesforce.
Which three considerations should be evaluated and highlighted when deciding between the solutions?
Choose 3 answers

- A. Message sequence is possible in Outbound Message but not guaranteed with Platform Events. Both offer very high reliability. Fault handling and recovery are fully handled by Salesforce.
- B. Both Platform Events and Outbound Message offer declarative means for asynchronous near-real time needs. They aren't

best suited for real-time integrations.
- C. Number of concurrent subscribers to Platform Events is capped at 2,000. An Outbound Message configuration can pass only 100 notifications in a single message to a SOAP end point.
- D. Both Platform Events and Outbound Message are highly scalable. However, unlike Outbound Message, only Platform Events have Event Delivery and Event Publishing limits to be considered.
- E. In both Platform Events and Outbound Messages, the event messages are retried by and delivered in sequence, and only once. Salesforce ensures there is no duplicate message delivery.

Answer: C,D,E

Explanation:
Explanation
Both Platform Events and Outbound Message offer declarative means for asynchronous near-real time needs.
They aren't best suited for real-time integrations (A). In both Platform Events and Outbound Messages, the event messages are retried by and delivered in sequence, and only once. Salesforce ensures there is no duplicate message delivery (B). Message sequence is possible in Outbound Message but not guaranteed with Platform Events. Both offer very high reliability. Fault handling and recovery are fully handled by Salesforce
Number of concurrent subscribers to Platform Events is capped at 2,000. An Outbound Message configuration can pass only 100 notifications in a single message to a SOAP end point (D). Both Platform Events and Outbound Message are highly scalable. However, unlike Outbound Message, only Platform Events have Event Delivery and Event Publishing limits to be considered (E).

NEW QUESTION # 44
A business requires automating the check and updating of the phone number type classification for all incoming calls. Up to 100,000 calls per day are received, and the business is flexible with timing (every 6-12 hours is sufficient). A Remote-Call-In and/or Batch Synchronization pattern via middleware is planned.
Which component should an integration architect recommend to implement these patterns?

- A. Connected App configured in Salesforce to authenticate the middleware
- B. An API Gateway that authenticates requests from Salesforce into the middleware (ETL/ESB)
- C. Remote Site Settings configured in Salesforce to authenticate the middleware

Answer: A

Explanation:
In a Remote-Call-In or Batch Synchronization pattern where an external middleware initiates the connection to Salesforce, the external system must be authenticated. The standard Salesforce framework for this is the Connected App.
A Connected App provides a framework for external applications to integrate with Salesforce using APIs and standard protocols like OAuth 2.0. For a high-volume (100,000 records) batch process initiated by middleware every 6-12 hours, the architect would recommend a Connected App using a secure flow, such as the OAuth 2.0 JWT Bearer Flow. This allows the middleware to authenticate as a specific "Integration User" without storing clear-text passwords.
Option A (API Gateway) is used to manage and secure outbound calls from Salesforce or between external services; it does not handle inbound authentication to the Salesforce org itself. Option B (Remote Site Settings) is a whitelist configuration used purely to allow Salesforce to make outbound callouts to a specific URL; it provides no authentication mechanism for systems calling into Salesforce. By recommending a Connected App, the architect ensures that the middleware has the necessary permissions (scopes) to use the Bulk API-which is the appropriate mechanism for the 100,000 record volume-while maintaining a secure, auditable, and standard integration boundary.

NEW QUESTION # 45
A large enterprise customer operating in a high regulated industry is planning to implement Salesforce for customer facing associates in both Sales and Service, and back-office staff. The business processes that Salesforce supports are critical to the business.
Salesforce will be integrated to multiple back-office systems to provide a single interface for associates.
Reliability and monitoring of these integrations are required as associates support customers.
Which integration solution should the architect consider when planning the implementation?

- A. Decouple back-office system callouts into separate distinct services that have inbuilt error logging and monitoring frameworks.
- B. Build a custom integration gateway to support back-office system integrations and ensure reliability and monitoring capabilities.

- C. Architect Services in back-office systems to support callouts from Salesforce and build reliability, monitoring and reporting capabilities.
- D. Leverage Middleware for all back-office system integrations ensuring real time alerting, monitoring and reporting capabilities.

Answer: D

Explanation:
Explanation
Leveraging Middleware for all back-office system integrations ensuring real time alerting, monitoring and reporting capabilities is the best integration solution for this scenario. Middleware is a software layer that acts as an intermediary between Salesforce and other systems, providing a common platform for data transformation, routing, orchestration, security, error handling, logging, and monitoring. Middleware can help to ensure reliability and performance of the integrations, as well as provide visibility and control over the integration processes. Middleware can also support various integration patterns and protocols, such as SOAP, REST, JMS, etc. Reference: Salesforce Integration Architecture Designer Resource Guide, page 14

NEW QUESTION # 46
......

Because the Salesforce Certified Integration Architect (Integration-Architect) practice exams create an environment similar to the real test for its customer so they can feel themselves in the Salesforce Certified Integration Architect (Integration-Architect) real test center. This specification helps them to remove Salesforce Certified Integration Architect (Integration-Architect) exam fear and attempt the final test confidently.
