## HP Aruba Certified Network Security Associate Exam Sample Questions (Q113-Q118):

### NEW QUESTION # 113

What is one way that WPA3-PerSonai enhances security when compared to WPA2-Personal?

- A. WPA3-Personal is more complicated to deploy because it requires a backend authentication server
- B. WPA3-Personai prevents eavesdropping on other users' wireless traffic by a user who knows the passphrase for the

WLAN.

- C. WPA3-Person3i is more secure against password leaking Because all users have their own username and password
- D. WPA3-Personal is more resistant to passphrase cracking Because it requires passphrases to be at least 12 characters

**Answer: C**

#### NEW QUESTION # 114

What is a reason to set up a packet capture on an Aruba Mobility Controller (MC)?

- A. You want the MC to analyze wireless clients' traffic at a lower level, so that the ArubaOS firewall can control Web traffic based on the destination URL.
- B. The security team believes that a wireless endpoint connected to the MC is launching an attack and wants to examine the traffic more closely.
- C. You want the MC to analyze wireless clients' traffic at a lower level, so that the ArubaOS firewall can control the traffic based on application.
- D. The company wants to use ClearPass Policy Manager (CPPM) to profile devices and needs to receive HTTP User-Agent strings from the MC.

**Answer: C**

#### NEW QUESTION # 115

What is a use case for Transport Layer Security (TLS)?

- A. to enable a client and a server to establish secure communications for another protocol
- B. to establish a framework for devices to determine when to trust other devices' certificates
- C. to provide a secure alternative to certificate authentication that is easier to implement
- D. to enable two parties to asymmetrically encrypt and authenticate all data that passes between them

**Answer: A**

Explanation:

The use case for Transport Layer Security (TLS) is to enable a client and a server to establish secure communications for another protocol. TLS is a cryptographic protocol designed to provide secure communication over a computer network. It is widely used for web browsers and other applications that require data to be securely exchanged over a network, such as file transfers, VPN connections, and voice-over-IP (VoIP). TLS operates between the transport layer and the application layer of the Internet Protocol Suite and is used to secure various other protocols like HTTP (resulting in HTTPS), SMTP, IMAP, and more. This protocol ensures privacy and data integrity between two communicating applications. Detailed information about TLS and its use cases can be found in IETF RFC 5246, which outlines the specifications for TLS 1.2, and in subsequent RFCs that define TLS 1.3.

#### NEW QUESTION # 116

What is a benefit of Opportunistic Wireless Encryption (OWE)?

- A. It allows anyone to connect, but provides better protection against eavesdropping than a traditional open network
- B. It provides protection for wireless clients against both honeypot APs and man-in-the-middle (MIM) attacks
- C. It offers more control over who can connect to the wireless network when compared with WPA2-Personal
- D. It allows both WPA2-capable and WPA3-capable clients to authenticate to the same WPA-Personal WLAN

**Answer: A**

Explanation:

The benefit of Opportunistic Wireless Encryption (OWE) is that it allows anyone to connect, but it provides better protection against eavesdropping than a traditional open network. OWE is a type of wireless security specified in the WPA3 standard that offers encrypted communication without the complexity of a full authentication process, thereby securing data on networks that would otherwise be open and unencrypted.

:

Wi-Fi Alliance specifications for WPA3 and Opportunistic Wireless Encryption (OWE).

Security whitepapers and industry articles discussing the advantages of WPA3, including OWE.

## NEW QUESTION # 117

What is a vulnerability of an unauthenticated Dime-Hellman exchange?

- A. A brute force attack can relatively quickly derive Diffie-Hellman private values if they are able to obtain public values
- B. Diffie-Hellman with elliptic curve values is no longer considered secure in modern networks, based on NIST recommendations.
- C. A hacker can replace the public values exchanged by the legitimate peers and launch an MITM attack.
- D. Participants must agree on a passphrase in advance, which can limit the usefulness of Diffie-Hellman in practical contexts.

**Answer: C**
