Salesforce Certified MuleSoft Integration Associate Exam Sample Questions (Q20-Q25):

NEW QUESTION # 20

CloudHub is an example of which cloud computing service model?

- A. Infrastructure as a Service (IaaS)
- B. Software as a Service (SaaS)
- C. Monitoring as a Service (MaaS)
- D. Platform as a Service (PaaS)

Answer: D

Explanation:

CloudHub is MuleSoft's integration platform as a service (iPaaS) offering. It provides a platform for deploying and managing integration applications in the cloud. Here's a detailed explanation:

- * Platform as a Service (PaaS):
- * Definition: PaaS provides a cloud-based environment with everything required to support the complete lifecycle of building and deploying web applications and services without the complexity of managing the underlying hardware and software layers.
- * CloudHub Features:
- * Deployment: Simplifies the deployment of Mule applications to the cloud.
- * Management: Provides tools for managing application performance, scaling, and monitoring.
- * Connectivity: Offers out-of-the-box connectors and integration capabilities for various systems and services.
- * Benefits:
- * Scalability: Automatically scales applications based on demand.
- * Availability: Ensures high availability and reliability with built-in disaster recovery and failover capabilities.
- * Security: Provides robust security features to protect data and applications.

NEW QUESTION # 21

Which productivity advantage does Anypoint Platform have to both implement and manage an API?

- **A. Automatic API proxy generation**
- B. Automatic API semantic versioning
- C. Automatic API specification generation
- D. Automatic API governance

Answer: A

Explanation:

Anypoint Platform, MuleSoft's unified platform for API design and integration, offers several productivity advantages for both implementing and managing APIs. Among these features, automatic API proxy generation is particularly beneficial. Here's a step-by-step explanation:

- * API Implementation:
- * Design Center: In the Design Center, users can create API specifications using RAML or OAS. This environment provides tools to design and document APIs effectively.
- * Exchange: After defining the API, it can be published to Anypoint Exchange where it can be shared and discovered by others within the organization.
- * Automatic API Proxy Generation:
- * When an API is published to Exchange, Anypoint Platform allows for the automatic creation of an API proxy. An API proxy acts as a facade for your backend API, providing a layer of abstraction and security.
- * Advantages:
- * Security: Protects backend services by exposing only necessary endpoints and handling authentication, authorization, and rate limiting.
- * Traffic Management: Helps in managing traffic through throttling and caching.
- * Monitoring: Facilitates monitoring and logging to track API usage and performance.
- * This automation saves time and reduces the complexity of manual proxy setup, allowing developers to focus on core business logic.
- * API Management:
- * API Manager: Provides a dashboard to manage API policies, versions, and SLA tiers. Users can apply security policies, monitor traffic, and analyze API usage.
- * Monitoring: Integrated with Anypoint Monitoring, users get insights into API performance and health, enabling proactive management.

NEW QUESTION # 22

An API client makes an HTTP request to an API gateway with an Accept header containing the value

"application/json"

What is a valid HTTP response payload for this request in the client's requested data format?

- A. status: healthy
- B. status('healthy')
- C. {"status": "healthy"}
- D. <status>healthy</status>

Answer: C

Explanation:

When an API client makes an HTTP request with an Accept header containing the value "application/json", the API server should respond with a payload formatted as JSON. Here's a detailed explanation:

* Accept Header:

* Purpose: The Accept header indicates the media type(s) that the client is willing to receive from the server.

* Value "application/json": Specifies that the client expects a response in JSON format.

* Valid JSON Response:

* Format: JSON (JavaScript Object Notation) is a lightweight data interchange format that uses key-value pairs.

* Example: A valid JSON response for the requested format would be {"status": "healthy"}.

* Key: "status"

* Value: "healthy"

NEW QUESTION # 23

An integration architect is designing an API that must accept requests from API clients for both XML and JSON content over HTTP/1.1 by default.

Which API architectural style when used for its intended and typical purposes, should the architect choose to meet these requirements?

- A. REST
- B. GraphQL
- C. SOAP
- D. gRPC

Answer: A

Explanation:

REST (Representational State Transfer) is an architectural style commonly used for designing networked applications, particularly APIs that need to handle multiple content types over HTTP. Here's a detailed explanation:

* Content Negotiation:

* Definition: REST APIs support content negotiation, allowing clients to request either XML or JSON formats by setting the Accept header in HTTP requests.

* Flexibility: This capability makes REST ideal for scenarios where an API needs to serve multiple content types.

* HTTP Protocol:

* Usage: REST APIs operate over HTTP/1.1, making them compatible with web standards and easily accessible by various clients (browsers, mobile apps, etc.).

* Methods: Supports standard HTTP methods like GET, POST, PUT, DELETE, allowing for CRUD operations.

* Advantages:

* Stateless: Each request from a client to server must contain all the information needed to understand and process the request.

* Scalability: RESTful services can handle a high load of requests efficiently.

NEW QUESTION # 24

An organization is not meeting its growth and innovation objectives because IT cannot deliver projects fast enough to keep up with the pace of change required by the business.

According to MuleSoft's IT delivery and operating model which step should the organization take to solve this problem?

- **A. Adopt a new approach that decouples core IT projects from the innovation that happens within each line of business**
- B. Switch from a design-first to a code-first approach for IT development
- C. Modify IT governance and security controls so that line of business developers can have direct access to the organization's systems of record
- D. Hire more IT developers, architects, and project managers to increase IT delivery

Answer: A

Explanation:

MuleSoft's IT delivery and operating model suggests modernizing IT practices to better support business growth and innovation.

Here's a detailed explanation:

* Decoupling Core IT Projects:

* Definition: Decoupling involves separating the core IT systems and projects from the innovative and experimental projects conducted by various lines of business.

* Benefits:

* Agility: Enables lines of business to innovate rapidly without being held back by the constraints of core IT systems.

* Focus: Allows core IT to focus on maintaining and enhancing critical systems while business units can experiment and deploy new solutions more quickly.

* Implementation:

* API-led Connectivity: By using an API-led connectivity approach, core IT can expose reusable APIs and services that business units can leverage for their innovation efforts.

* Governance and Security: Ensuring that proper governance and security measures are in place to protect core systems while allowing flexibility for innovation.

* Outcome:

* Faster Delivery: Speeds up the delivery of new features and solutions, aligning with business needs and market demands.

* Enhanced Collaboration: Facilitates better collaboration between IT and business units, driving overall organizational growth.
