There are three data migration options when a host in a vSAN cluster is placed into **maintenance** mode:

- Ensure accessibility (default) - vSAN only migrates the components that are essential for running VMs. This option is typically used when taking a host out of the cluster temporarily.
- **Full data migration** - vSAN transfers all the data from this host to the other hosts in the cluster. This option is typically used when **removing a host permanently**.
- No data migration - vSAN does not evacuate any data from the host. This option is typically used when shutting down an entire cluster.
