Fortinet EMEA Advanced Support Exam Sample Questions (Q28-Q33):

NEW QUESTION # 28

Which FortiGate log type records denied traffic events?

- A. Security Log
- B. System Log
- C. Traffic Log
- D. Event Log

Answer: C

Explanation:

Traffic Logs in FortiGate record all traffic events, including denied packets, with details like source, destination, and policy ID. Security Logs (B) cover UTM events, Event Logs (C) system events, and System Logs (D) hardware or system status, not specifically denied traffic. Exact extract: "Traffic Logs record all packet activity, including allowed and denied traffic, with details such as source/destination IPs, ports, and the firewall policy applied."

NEW QUESTION # 29

What does the below route indicate?

- A. The destination network is locally connected on that interface
- B. The device does not know the destination
- C. The destination network can be reached via any gates
- D. It is a dummy route in the routing table

Answer: A

Explanation:

A route with a directly connected interface (no gateway) indicates the destination network is locally attached to that interface on the FortiGate. This is common for networks directly connected to the device's interfaces.

Option A is vague, B is incorrect as it's not a dummy route, and D suggests an unknown route, which isn't the case. Exact extract: "A directly connected route indicates that the destination network is locally attached to the interface specified in the routing table... No gateway is required for such routes as the FortiGate is directly connected to the network."

NEW QUESTION # 30

Which statement is true about IPsec VPNs and SSL VPNs?

- A. Either a SSL VPN or an IPsec VPN can be established between an end-user workstation and a FortiGate device
- B. Both SSL VPNs and IPsec VPNs are standard protocols
- C. All of the above
- D. SSL VPN creates a HTTPS connection. IPsec does not

Answer: C

Explanation:

Both SSL VPN and IPsec VPN are standard protocols supported by FortiGate devices for secure remote access. SSL VPN typically uses HTTPS (TCP port 443) for encrypted communication, while IPsec uses protocols like IKE and ESP. Both can be configured between an end-user workstation (e.g., via FortiClient) and a FortiGate device, supporting various authentication methods. All options are correct, making D the correct answer. Exact extract: "SSL VPN technology uses the standard SSL/TLS protocol to provide a secure connection to the FortiGate unit. The FortiGate SSL VPN can be configured to use HTTPS..." and "IPsec VPNs use standardized protocols like IKE and ESP to create secure tunnels... FortiClient supports both IPsec and SSL VPN connections to FortiGate devices for remote access."

NEW QUESTION # 31

What is the default FortiGate behavior when a packet matches no firewall policy?

- A. The packet is forwarded to the default gateway
- B. The packet is sent to the IPS engine
- **C. The packet is dropped**
- D. The packet is logged and allowed

Answer: C

Explanation:

FortiGate operates on a default-deny principle; if a packet does not match any firewall policy, it is dropped to ensure security. No forwarding (A), IPS processing (C), or automatic allowing (D) occurs without a matching policy. Exact extract: "FortiGate uses a default-deny approach; packets that do not match any configured firewall policy are dropped to prevent unauthorized traffic."

NEW QUESTION # 32

Which of the following is a network monitoring protocol?

- A. RDP
- B. Telnet
- **C. SNMP**
- D. SSH

Answer: C

Explanation:

SNMP (Simple Network Management Protocol) is specifically designed for monitoring and managing network devices, allowing administrators to query device status, performance metrics, and configure alerts for issues. It operates by using agents on devices that report to a central manager. In contrast, RDP is for remote desktop access, Telnet for unsecure remote command-line access, and SSH for secure remote access. SNMP is the standard protocol for network monitoring in Fortinet products like FortiGate, FortiSwitch, etc. Exact extract: SNMP enables administrators to monitor how devices are performing and make changes to network devices so that data moves through the network more efficiently. Simple Network Management Protocol (SNMP) enables you to monitor hardware on your network. The FortiSwitch SNMP implementation is read-only. Monitoring FortiAP with SNMP. You can enable SNMP directly on FortiAP by implementing a SNMPPD daemon/subagent on the FortiAP side. The Simple Network Management Protocol (SNMP) allows you to monitor hardware on your network. You can configure the hardware, such as the FortiProxy SNMP agent.
