Esri Enterprise Administration Professional 2201 Sample Questions (Q30-Q35):

NEW QUESTION # 30
A GIS administrator is architecting a new ArcGIS Enterprise deployment. The organization has grown and evolved since the initial deployment. The organization is having difficulty meeting the existing Service Level Agreement.
Recently, the team rolled out a series of web tools that are used in various applications throughout the organization. In the existing deployment, users report poor performance when the web tools are used.
Which action should the GIS administrator perform?

- A. Dedicate an ArcGIS Server site for analysis to use workload separation
- B. Install an additional ArcGIS Enterprise deployment for analysis workflows
- C. Configure additional ArcGIS Server machines within the existing ArcGIS Server site

Answer: A

Explanation:
Workload separation is a best practice in ArcGIS Enterprise architecture. By dedicating a separate ArcGIS Server site for analysis tasks, such as geoprocessing services used in web tools, system resources can be managed more effectively, and performance can be improved. This configuration avoids overloading a single site and ensures that interactive web applications are not affected by resource-intensive analysis tools.
Adding more machines to the same site (Option A) does not isolate workloads and may still result in contention. Installing an entirely new ArcGIS Enterprise deployment (Option C) increases complexity and administration effort unnecessarily. The recommended solution is to implementa dedicated ArcGIS Server site for analysisas part of a federated multi-site deployment.

NEW QUESTION # 31
A new user is added to the organization and can see roads, building footprints, parcels, and traffic data shared with them in Portal for ArcGIS. However, the user cannot use analysis tools in the portal, even though the SpatialAnalysisTools service is verified to be running.
What is causing this issue?

- A. The new user is a Creator user type
- B. The service needs to be published as a hosted layer
- C. The hosting server has not been configured
- D. SpatialAnalysisTools needs to be restarted

Answer: A

NEW QUESTION # 32
An organization experiences a temporary loss of service for its ArcGIS Enterprise deployment due to expired licenses.
What should the administrator have done to prevent this issue?

- A. Configure the ArcGIS Enterprise portal to send an automated email when the portal license is expiring
- B. Create a Python script to run an administrative report and schedule the script to run regularly
- C. Use the license file in read-only mode to extend the license
- D. Design an information banner to automatically display the license expiration date

Answer: A

NEW QUESTION # 33

An organization configures an ArcGIS Enterprise portal to allow single sign-on using Integrated Windows Authentication (IWA). Configuration includes:
* All accounts in the Active Directory group gisusers are added to the portal
* Existing users can sign in without entering credentialsHowever, new employees assigned to the same gisusers group cannot log in, create content, or join groups.What is causing this issue for the new employees?

- A. Their Active Directory accounts have not had sufficient time to sync to the portal
- B. Their Active Directory accounts have not been added to the portal
- C. The Web Adaptor cache must be cleared
- D. Their Active Directory accounts have been assigned an incompatible default user type

Answer: D

NEW QUESTION # 34
A GIS administrator installs and configures an ArcGIS GeoAnalytics Server machine with four cores and 16 GB of RAM. Users experience a slowdown when analyzing large datasets.
Which action should the administrator perform?

- A. Set the GeoAnalytics Server as the hosting server
- B. Add 16 GB of RAM to the GeoAnalytics Server machine
- C. Add two cores to the GeoAnalytics Server machine

Answer: B

Explanation:
ArcGIS GeoAnalytics Server is designed to perform distributed analysis on largevolumes of spatial and temporal data. To efficiently process large datasets, it is recommended that each machine in the GeoAnalytics Server site has at least 16 GB of RAM and 4 CPU cores. However, for optimal performance, especially when handling very large datasets, increasing the available RAM can significantly improve processing times.
In this scenario, the machine already has 16 GB of RAM and 4 cores. Adding more RAM would allow the GeoAnalytics Server to allocate more memory per job, enhancing its ability to process large datasets efficiently. Therefore, the recommended action is to add 16 GB of RAM to the GeoAnalytics Server machine.
